## Linux Foundation Certified GitOps Associate Sample Questions (Q27-Q32):

### NEW QUESTION # 27

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. git branch
- **B. git revert**
- C. git commit
- D. git push

**Answer: B**

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct

answer is B: git revert.

### NEW QUESTION # 28

When using Kustomize, how are resources, configurations, and customizations commonly organized?

- A. In a single configuration file.
- B. Using a combination of folder directories and referenced folder/file paths.
- C. By specifying all resources inline in the customization file.
- D. In separate configuration files for each resource.

**Answer: B**

Explanation:

Kustomize is a GitOps tool for managing Kubernetes configurations declaratively. It uses a folder structure with configuration files and a `kustomization.yaml` file that references resources and overlays. This enables customization without modifying the base manifests. "Kustomize allows customization of Kubernetes manifests by organizing resources in directories and referencing them through file paths in a `kustomization` file. This directory-based approach supports overlays, reusability, and modular configuration." Thus, the correct answer is D.

### NEW QUESTION # 29

In the context of GitOps, what is one example of how DevSecOps principles manifested, enhancing the traditional DevOps lifecycle?

- A. In GitOps, DevSecOps leads to the segregation of security tasks, assigning them exclusively to security teams.
- B. GitOps enhances the DevSecOps experience by detecting security policy drift.
- C. DevSecOps in GitOps focuses primarily on post-deployment security audits.
- D. GitOps uses DevSecOps to enforce manual security checks at each deployment stage.

**Answer: B**

Explanation:

In GitOps, DevSecOps integrates security into the GitOps workflow by treating security policies as code and storing them in Git. This enables automatic detection of security policy drift and ensures that any misconfiguration or violation is reconciled, just like application and infrastructure code.

"GitOps applies DevSecOps by managing security policies as code. This enables detection of drift in security configurations, ensuring environments remain compliant and secure." Thus, the correct answer is A.

### NEW QUESTION # 30

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Create a new version based on a former version so you always "roll forward".
- B. Overwrite your existing version with the code from your last working version.
- C. Revert to an older version and force push to the main branch.
- D. Use Helm to rollback to a previous release version.

**Answer: A**

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

## NEW QUESTION # 31

In GitOps, how is the Desired State stored?

- A. In a way that enforces immutability and versioning
- B. In a way that enforces mutability and versioning
- C. In a way that retains only the latest version.
- D. In a way that permits direct modifications to live systems.

**Answer: A**

Explanation:

The GitOps principle of Versioned and Immutable requires Desired State to be stored in a way that enforces immutability and versioning. This ensures every change is recorded, auditable, and reversible.

"Desired state must be kept in an immutable, version-controlled system. This guarantees a full history of changes and enables safe rollbacks." Thus, the correct answer is D.
