

100% Pass Quiz 2025 Amazon SOA-C02: AWS Certified SysOps Administrator - Associate (SOA-C02)–The Best Examcollection Dumps Torrent

BONUS!!! Download part of Actual4Exams SOA-C02 dumps for free: https://drive.google.com/open?id=1SOsaS_iR3cyIyv_FQTDMoLR7GaHy_Q0

Do you want to spend the least time to pass your exam? If you do, then we will be your best choice. SOA-C02 training materials are compiled by experienced experts who are quite familiar with the exam center, so the quality can be guaranteed. In addition, SOA-C02 exam materials contain most of the knowledge points for the exam, and you can have a good command of these knowledge points through practicing. In order to strengthen your confidence for the SOA-C02 Exam Braindumps, we are pass guarantee and money back guarantee if you fail to pass the exam. The money will be returned to your payment account.

Amazon SOA-C02 Exam is an important step towards becoming an AWS Certified SysOps Administrator at the associate level. SOA-C02 exam tests an individual's knowledge of AWS services and their ability to use them to build, deploy and manage highly available and scalable systems. Candidates should have a strong understanding of AWS services and their use cases and should have experience in deploying, managing, and operating highly available and scalable systems on AWS. AWS offers a variety of training and certification courses that can help candidates prepare for the exam.

Free PDF Amazon SOA-C02 AWS Certified SysOps Administrator - Associate (SOA-C02) First-grade Examcollection Dumps Torrent

Our company really took a lot of thought in order to provide customers with better SOA-C02 learning materials. First of all, in the setting of product content, we have hired the most professional team who analyzed a large amount of information and compiled the most reasonable SOA-C02 Exam Questions. And you can find the most accurate on our SOA-C02 study braindumps. Secondly, our services are 24/7 available to help our customers solve all kinds of questions.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q291-Q296):

NEW QUESTION # 291

A company deploys an application on AWS behind an internet-facing Application Load Balancer (ALB) in the us-west-2 Region. Amazon Route 53 manages DNS CNAME records for the application. The company is replicating its AWS infrastructure to the eu-west-2 Region.

A SysOps administrator must implement a Route 53 configuration to distribute application traffic across both Regions. Which solution will meet these requirements with the LEAST application response time?

- A. Apply a latency-based routing policy to the CNAME records of both ALBs.
- B. Create a multivalued answer routing policy. Add the public IP addresses for both ALBs.
- C. Create a new private hosted zone that includes a CNAME record for the ALB that is in eu-west-2.
- D. Apply a geolocation routing policy to the CNAME records of both ALBs.

Answer: A

Explanation:

A latency-based routing policy in Amazon Route 53 directs traffic to the AWS Region that provides the lowest latency for the user. This ensures that users experience the fastest response times by being directed to the nearest available Region.

Route 53 continuously monitors the latency of requests and routes users to the Region with the lowest latency. This setup helps optimize application response time while maintaining high availability. The ALBs in each Region ensure that traffic is handled efficiently once it reaches the AWS infrastructure.

NEW QUESTION # 292

A software development company has multiple developers who work on the same product. Each developer must have their own development environments, and these development environments must be identical. Each development environment consists of Amazon EC2 instances and an Amazon RDS DB instance. The development environments should be created only when necessary, and they must be terminated each night to minimize costs.

What is the MOST operationally efficient solution that meets these requirements?

- A. Provide developers with access to the same AWS CloudFormation template so that they can provision their development environment when necessary. Schedule a nightly Amazon EventBridge (Amazon CloudWatch Events) rule to invoke an AWS Lambda function to delete the AWS CloudFormation stacks.
- B. Provide developers with access to the same AWS CloudFormation template so that they can provision their development environment when necessary. Schedule a nightly cron job on each development instance to stop all running processes to reduce CPU utilization to nearly zero.
- C. Provide developers with CLI commands so that they can provision their own development environment when necessary. Schedule a nightly Amazon EventBridge (Amazon CloudWatch Events) rule to invoke an AWS Lambda function to terminate all EC2 instances and the DB instance.
- D. Provide developers with CLI commands so that they can provision their own development environment when necessary. Schedule a nightly Amazon EventBridge (Amazon CloudWatch Events) rule to cause AWS CloudFormation to delete all of the development environment resources.

Answer: A

Explanation:

<https://docs.aws.amazon.com/eventbridge/latest/userguide/eb-run-lambda-schedule.html> +

<https://aws.amazon.com/blogs/mt/using-aws-lambda-to-decommission-products-provisioned-from-an-aws-service-catalog/>

portfolio/ Ideally you want to delete the Stack, not just the EC2 and RDS instances. Persistent EBS volumes and snapshots may still exist that can incur cost.

NEW QUESTION # 293

An organization finds that a high number of gp2 Amazon EBS volumes are running out of space. Which solution will provide the LEAST disruption with MINIMAL effort?

- A. Create a snapshot and restore it to a larger gp2 volume.
- **B. Leverage the Elastic Volumes feature of EBS to increase gp2 volume size.**
- C. Create a RAID 0 with another new gp2 volume to increase capacity.
- D. Write a script to migrate data to a larger gp2 volume.

Answer: B

Explanation:

<https://aws.amazon.com/ebs/features/>

NEW QUESTION # 294

A SysOps administrator is unable to launch Amazon EC2 instances into a VPC because there are no available private IPv4 addresses in the VPC. Which combination of actions must the SysOps administrator take to launch the instances? (Select TWO.)

- **A. Create a new subnet for the VPC**
- **B. Associate a secondary IPv4 CIDR block with the VPC**
- C. Associate a primary IPv6 CIDR block with the VPC
- D. Modify the CIDR block of the subnet that is associated with the instances
- E. Modify the CIDR block of the VPC

Answer: A,B

Explanation:

To launch EC2 instances when there are no available private IPv4 addresses in the VPC, the SysOps administrator should associate a secondary IPv4 CIDR block with the VPC and create a new subnet for the VPC.

* Associate a Secondary IPv4 CIDR Block:

* Open the VPC console.

* Select the VPC and choose "Actions" -> "Edit CIDRs."

* Add a secondary IPv4 CIDR block to increase the number of available IP addresses.

* Create a New Subnet:

* After adding the secondary CIDR block, create a new subnet within this CIDR block.

* This new subnet will provide additional private IP addresses for launching new EC2 instances.

Associating a CIDR Block with Your VPC

Creating a Subnet

NEW QUESTION # 295

A company has an existing public web application for www.example.com. The Application Load Balancer (ALB) is configured with a single HTTP 80 listener. A SysOps administrator must ensure that all web requests to www.example.com are encrypted between the client and the ALB.

The SysOps administrator already has requested and validated a public certificate for www.example.com in AWS Certificate Manager (ACM). Existing users of the application must not be required to change the endpoint to which they are connecting.

Which additional set of steps should the SysOps administrator take to meet these requirements?

- A. Create an additional ALB listener for HTTPS on port 443. Set the default action to forward all traffic to the target group. Specify the ACM certificate that was created for www.example.com as the default SSL certificate.
- B. Create an additional ALB listener for HTTPS on port 443. Set the default action to forward all traffic to the target group. Specify the ACM certificate that was created for www.example.com as the default SSL certificate. Delete the original HTTP listener on port 80.
- **C. Modify the ALB default rule for the HTTP port 80 listener to redirect to HTTPS on port 443. Create an additional HTTPS listener on port 443. Set the default action to forward all traffic to the target group. Specify the ACM certificate that**

was created for www.example.com as the default SSL certificate.

- D. Modify the ALB default rule for the HTTP port 80 listener. Create a rule in the listener to forward all traffic for the host www.example.com to the target group. Specify the ACM certificate that was created for www.example.com as the default SSL certificate.

Answer: C

NEW QUESTION # 296

.....

Nowadays in this talented society SOA-C02 professionals are very popular, but the IAmazon area are also very competitive. So many Amazon professionals through passing difficult SOA-C02 Certification exams to stabilize themselves. Actual4Exams is websites specifically provide convenience for candidates participating in the SOA-C02 certification exams.
