Here's the Right and Proven Way to Pass ISQI CTFL-AcT Exam

Life is so marvelous that you can never know what will happen next. Especially when you feel most desperate to your life, however,

there may be different opportunities to change your career. Just like getting CTFL-AcT certificate, you may want to give up because of its difficulties, but the appearance of our CTFL-AcT Study Materials are the best chance for you to pass the CTFL-AcT exam and obtain CTFL-AcT certification. This is our target that helps you to make it easier to get CTFL-AcT certification and you can find job more easily.

ISQI ISTQB Foundation Level - Acceptance Testing Sample Questions (Q13-Q18):

NEW QUESTION # 13

For a project to migrate an employee qualification management system to web technologies, the following requirement has been defined REQ 3-12 The system must be able to manage 3 types of users: HR team member with full rights, department manager with consultation and update rights only for members of his/her department, and employee with read-only access to his/her data Which of the following sentences BEST reflects an acceptable acceptance criterion?

- A. The database must use MongoDB
- B. Since I am logged in as a department manager, when I try to access the file of an employee who is not in my department then a message telling me that I do not have access rights is displayed
- C. Security test must be performed to demonstrate that the authentication and rights management system is working properly
- D. The list of employees who are members of a department can only be updated by a person logged as HR

Answer: B

Explanation:

Acceptance criteria should define how the system behaves for a given user story or requirement. They must be precise, testable, and directly traceable to the requirement being verified.

REQ 3-12 describes access control for three user types. Option B is a concrete, scenario-based acceptance criterion that tests the enforcement of access rights - making it an ideal match.

Other options:

A is irrelevant - database technology (MongoDB) is an implementation detail, not a functional criterion.

C is too vague - stating that security tests must be performed doesn't specify expected behavior or outcome.

D is plausible, but option B more directly demonstrates how an actual system behavior validates the requirement.

B). Since I am logged in as a department manager, when I try to access the file of an employee who is not in my department then a message telling me that I do not have access rights is displayed

NEW QUESTION # 14

Which of the following sentences explains BEST how business process and business rule modeling can be used for ATDD?

- A. In an ATDD approach, testers use business process and business rule models to generate acceptance tests.
- B. In an ATDD approach, business process/rule models must be created before the project starts.
- C. In an ATDD approach, process models are created for initial test design but are not maintained afterwards.
- D. In an ATDD approach, business process models replace acceptance criteria.

Answer: A

NEW QUESTION # 15

Which TWO of the following statements about exploratory testing are most true?

- A. Exploratory testing is rather carried out by people with a good knowledge of the business domain, but not necessarily of the tested functionality
- B. Exploratory testing generally begins with the definition of the test charter that defines the detailed test L-' conditions
- C. Exploratory testing is achieved by combining product discovery, test design and execution, and results L- interpretation
- D. Exploratory testing implements time-boxed sessions to prioritize tests bases on product risk analysis
- E. Exploratory testing is and experience-based test technique which refines acceptance criteria into acceptance test cases

Answer: B,C

Explanation:

Exploratory testing is a dynamic testing technique where learning, test design, execution, and interpretation occur simultaneously. It is especially useful when detailed requirements are unavailable or when testers rely on experience and intuition.

A is correct: Exploratory testing combines exploration, learning about the product, designing and executing tests on the fly, and interpreting the results - all within the same session.

E is also correct: Exploratory testing usually starts with a high-level test charter that defines the mission, objectives, or focus area for the session. It may not define specific test conditions, but it outlines the scope and intent.

Other options:

B: Not accurate - while timeboxing is used, exploratory testing typically relies on charters and experience rather than detailed product risk analysis to prioritize.

C: Incorrect - exploratory testing is not about refining acceptance criteria; that's part of ATDD.

D: Partially true but misleading - good business domain knowledge helps, but understanding the functionality is also important in exploratory testing.

NEW QUESTION # 16

Which of the following pillars of UX requirement analysis is described BEST?

- A. During competition analysis, products from competitors are exposed to different environmental conditions
- B. During task analysis, business analysts observe users that work with existing products to determine required
