With the commitment of helping candidates to Pass D-ISM-FN-01 Exam, we have won wide approvals by our clients. We always take our candidates' benefits as the priority, so you can trust us without any hesitation.

EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q59-Q64):

NEW QUESTION # 59

Question:

A company is planning to implement an FC-NVMe SAN. Other than servers with NVMe HBAs, which two other components are required to build this type of SAN?

- A. NVMe storage systems
- B. Specialized NVMe-oF drivers on all servers
- C. Only NVMe SSDs in servers
- D. A dedicated 100 Gb/s Ethernet network
- E. FC-NVMe switches

Answer: A,E

Explanation:

To implement an FC-NVMe SAN(NVMe over Fibre Channel), you need:

NVMe storage systems that expose NVMe namespaces.

FC-NVMe capable switches that support the new NVMe protocol over Fibre Channel.

Servers with NVMe HBAs(already mentioned in the question).

* Option B: Ethernet networks are for NVMe-oF over TCP/RoCE, not FC-NVMe.

* Option E: These drivers are for TCP/RoCE, not FC transports.

NEW QUESTION # 60

Question:

Which information is contained in a stub file?

- A. Name and size of the archived file
- B. Address of the source file
- C. Address of the archived file
- D. Hard drive address storing the archived file

Answer: C

Explanation:

A stub file is a small placeholder file that remains on primary storage after data has been archived or moved to secondary storage.

It contains a pointer or address of the archived data's location.

When accessed, the data is transparently retrieved from the archive.

* Address of the source file and other options do not accurately describe a stub file's purpose.

NEW QUESTION # 61

Question:

What are the two benefits of using sub-LUN tiering?

- A. Reduced need for storage capacity
- B. Cost optimization

- C. Granular control over data placement
- D. Simplified storage management
- E. Reduced need for storage tiering policies

Answer: B,C

Explanation:

Sub-LUN tiering allows for the movement of data at a more granular level within a Logical Unit Number (LUN), enabling:

- * Granular control over data placement: Specific data blocks can be moved to appropriate storage tiers based on access patterns.
- * Cost optimization: Frequently accessed data resides on high-performance (and more expensive) storage, while less accessed data is moved to cost-effective storage, optimizing overall storage costs.

Other options:

- * Reduced need for storage capacity: Not directly impacted by sub-LUN tiering.
- * Reduced need for storage tiering policies: Policies are still required to manage data movement.
- * Simplified storage management: While sub-LUN tiering adds efficiency, it may introduce complexity in management.

NEW QUESTION # 62

Question:

What is the maximum number of VLANs that can be supported with one VLAN tag field?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

In Ethernet networking, VLANs (Virtual Local Area Networks) are identified using a 12-bit VLAN ID field in the IEEE 802.1Q standard. Since 12 bits can represent $2^{12} = 4096$ unique values, the maximum number of VLANs that can be supported is 4096.

- * 1024 and 2048: These values are less than the maximum and represent subsets of possible VLANs.
- * 8192: This exceeds the 12-bit limit and is not supported by the standard.

NEW QUESTION # 63

Question:

When troubleshooting a virtual machine, which file is most likely to provide a detailed history of the VM's behavior?

- A. Memory state file
- B. Configuration file
- C. Virtual disk file
- D. Log file

Answer: D

Explanation:

Log files record events and messages related to the operations of a virtual machine. They provide detailed information about the VM's behavior, errors, and system messages, which are crucial for troubleshooting.
