SAP Certified Associate - SAP Business Data Cloud Sample Questions (Q40-Q45):

NEW QUESTION # 40

Which features of Business Builder enhance semantic modeling?

There are 2 correct answers to this question.

Response:

- A. Load CSV files directly
- **B. Create calculated measures**
- C. Assign email notifications
- **D. Define business entities**

Answer: B,D

NEW QUESTION # 41

Related to data management, what are some capabilities of SAP Business Data Cloud? Note: There are 2 correct answers to this question.

- A. Delegate the integration of business data to partners and customers.
- **B. Harmonize customer business data across different Line of Business applications**
- C. Store customer business data in 3rd party hyperscaler environments.
- **D. Integrate and enrich customer business data for different analytics use cases.**

Answer: B,D

Explanation:

SAP Business Data Cloud (BDC) offers significant capabilities in data management, primarily focusing on creating a unified and actionable data foundation. Two key capabilities are to integrate and enrich customer business data for different analytics use cases. BDC pulls data from various SAP and non-SAP sources, allowing for consolidation and enhancement of this data to provide a comprehensive view for analytical purposes. This includes applying business context and semantic richness. Secondly, a critical capability is to harmonize customer business data across different Line of Business applications. BDC addresses the challenge of disparate data silos by creating a consistent data model and definitions across various operational systems (e.g., ERP, CRM, HR), ensuring that data is understood and used uniformly across the enterprise. While BDC leverages hyperscaler environments, "storing data" is a characteristic of its infrastructure, not a direct capability of data management provided by BDC itself. Delegating integration is an operational choice, not a core capability of the platform.

NEW QUESTION # 42

What are some features of the out-of-the-box reporting with intelligent applications in SAP Business Data Cloud? Note: There are 2 correct answers to this question.

- A. Manual creation of artifacts across all involved components
- **B. Automated data provisioning from business application to dashboard**
- C. AI-based suggestions for intelligent applications in the SAP Business Data Cloud Cockpit
- **D. Services for transforming and enriching data**

Answer: B,D

Explanation:

The out-of-the-box reporting capabilities with intelligent applications in SAP Business Data Cloud (BDC) are designed to streamline the analytical process and deliver immediate value. Two significant features include automated data provisioning from business application to dashboard. This means that intelligent applications handle the end-to-end flow of data, from its source in operational systems, through processing in BDC, and finally to visualization in dashboards, with minimal manual intervention. This automation ensures timely and consistent data delivery for reporting. Additionally, these intelligent applications leverage services for transforming and enriching data. As part of the pre-built logic within these applications, data is automatically transformed (e.g., aggregated, filtered) and enriched (e.g., adding calculated KPIs, combining with master data) to make it immediately suitable for reporting and analysis. This reduces the need for manual data manipulation by users, providing ready-to-consume insights.

NEW QUESTION # 43

The Data Access Language option determines the preferred language for which areas of SAP Analytics Cloud?

There are 2 correct answers to this question.

Response:

- A. Text
- B. Live Data
- C. Help
- D. Imported Data

Answer: A,B

NEW QUESTION # 44

Which of the following SAP Datasphere objects can you create in the Data Builder? Note: There are 3 correct answers to this question.

- A. Connections
- B. Replication Flows
- C. Spaces
- D. Task Chains
- E. Intelligent Lookups

Answer: B,D,E

Explanation:

The Data Builder in SAP Datasphere is the primary environment for data modeling and transformation activities. Within the Data Builder, users can create a variety of essential objects to build their data landscape. Among the options provided, you can create Intelligent Lookups (A), which are used for fuzzy matching and data cleansing operations to link disparate data sets. You can also create Task Chains (D), which are crucial for orchestrating and automating sequences of data integration and transformation processes, ensuring data pipelines run efficiently. Furthermore, Replication Flows (E) are designed and managed within the Data Builder, allowing you to configure and execute continuous or scheduled data replication from source systems into Datasphere. "Spaces" (B) and "Connections" (C) are typically managed at a higher administrative level within the SAP Datasphere tenant (e.g., in the System or Connection Management areas), not directly within the Data Builder itself, which focuses on data content and logic.
