Snowflake SnowPro Core Certification Exam Sample Questions (Q506-Q511):

NEW QUESTION # 506

Credit Consumption by the Compute Layer (Virtual Warehouses) is based on: (Choose two.)

- A. Warehouse size
- B. # of clusters for the Warehouse
- C. Number of users
- D. Amount of data processed

Answer: A,B

NEW QUESTION # 507

How does Snowflake ensure the integrity and consistency of data stored in tables?

- A. Row-level encryption
- B. Constraints
- C. Time Travel
- D. Dynamic Data Masking

Answer: B

NEW QUESTION # 508

What causes objects in a data share to become unavailable to a consumer account?

- A. The objects in the data share are being deleted and the grant pattern is not re-applied systematically.
- B. The DATA_RETENTION_TIME_IN_DAYS parameter in the consumer account is set to 0.
- C. The consumer account runs the GRANT IMPORTED PRIVILEGES command on the data share every 24 hours.
- D. The consumer account acquires the data share through a private data exchange.

Answer: A

Explanation:

Objects in a data share become unavailable to a consumer account if the objects in the data share are deleted or if the permissions on these objects are altered without re-applying the grant permissions systematically.

This is because the sharing mechanism in Snowflake relies on explicit grants of permissions on specific objects (like tables, views, or secure views) to the share. If these objects are deleted or if their permissions change without updating the share accordingly, consumers can lose access.

The DATA_RETENTION_TIME_IN_DAYS parameter does not directly affect the availability of shared objects, as it controls how long Snowflake retains historical data for time travel and does not impact data sharing permissions.

Running the GRANT IMPORTED PRIVILEGES command in the consumer account is not related to the availability of shared objects; this command is used to grant privileges on imported objects within the consumer's account and is not a routine maintenance command that would need to be run regularly.

Acquiring a data share through a private data exchange does not inherently make objects unavailable; issues would only arise if there were problems with the share configuration or if the shared objects were deleted or had their permissions altered without re-granting access to the share.

NEW QUESTION # 509

How often are encryption keys automatically rotated by Snowflake?

- **A. 30 Days**
- B. 90 Days
- C. 60 Days
- D. 365 Days

Answer: A

Explanation:

Snowflake automatically rotates encryption keys when they are more than 30 days old. Active keys are retired, and new keys are created. This process is part of Snowflake's comprehensive security measures to ensure data protection and is managed entirely by the Snowflake service without requiring user intervention.

NEW QUESTION # 510

What are characteristics of Snowflake directory tables? (Select TWO).

- **A. Directory tables store file-level metadata about the data files in a stage.**
- B. Directory tables contain copies of staged files in binary format.
- C. Directory tables can only be used with an external stage.
- D. Directory tables are separate database objects.
- **E. A directory table can be added to a stage when the stage is created, or later.**

Answer: A,E

Explanation:

* Directory tables store metadata about staged files, such as file names, sizes, and modification timestamps.

* Characteristics of directory tables:

* D: They store file-level metadata, which is useful for tracking and querying files in a stage.

* E: Directory tables can either be created when defining a stage or added later using ALTER STAGE.

Why Other Options Are Incorrect:

* A. Separate database objects: Directory tables are part of stages, not separate objects.

* B. Only used with external stages: Directory tables work with both internal and external stages.

* C. Contain binary copies of files: They store metadata, not file content.
