CTFL4 Minimum Pass Score, CTFL4 Reliable Mock Test

The ISTQB Certified Tester Foundation Level CTFL 4.0 (CTFL4) certification exam is one of the hottest and most industrial-recognized credentials that has been inspiring beginners and experienced professionals since its beginning. With the ISTQB Certified Tester Foundation Level CTFL 4.0 (CTFL4) certification exam successful candidates can gain a range of benefits which include career advancement, higher earning potential, industrial recognition of skills and job security, and more career personal and professional growth.

BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q95-Q100):

NEW QUESTION # 95

An alphanumeric password must be between 4 and 7 characters long and must contain at least one numeric character, one capital (uppercase) letter and one lowercase letter of the alphabet.

Which one of the following sets of test cases represents the correct outcome of a two-value boundary value analysis applied to the password length? (Note: test cases are separated by a semicolon)

- A. 1xA;aB11;Pq1ZZab;7iDD0a1x
- B. 1xB: aB11: 99rSp: 5NnN10; 4NnN10T; 44ghWn19
- C. aB11;99rSp:5NnN10;7iDD0a1x
- **D. 1RhT;rSp53;3N3e10;8sBdby**

Answer: D

Explanation:

The correct outcome of a two-value boundary value analysis applied to the password length is the set of test cases represented by option D. Boundary value analysis is a test design technique that focuses on the values at the boundaries of an equivalence partition, such as the minimum and maximum values, or the values just above and below the boundaries. A two-value boundary value analysis uses two values for each boundary, one representing the valid value and one representing the invalid value. For example, if the valid range of values is from 4 to 7, then the two values for the lower boundary are 3 and 4, and the two values for the upper boundary are 7 and 8. The test cases in option D use these values for the password length, while also satisfying the other requirements of the password, such as containing at least one numeric character, one capital letter, and one lowercase letter. The test cases in option D are:

1RhT: a 4-character password that is valid

rSp53: a 5-character password that is valid

3N3e10: a 6-character password that is valid

8sBdby: an 8-character password that is invalid The test cases in the other options are incorrect, because they either use values that are not at the boundaries of the password length, or they do not meet the other requirements of the password. For example, the test cases in option A are:

1xA: a 3-character password that is invalid, but it does not contain a capital letter aB11: a 4-character password that is valid

Pq1ZZab: a 7-character password that is valid

7iDD0a1x: an 8-character password that is invalid Reference: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents:

NEW QUESTION # 96

Which of the following is a test task that usually occurs during test implementation?

- A. Archive the testware for use in future test projects
- B. Gather the metrics that are used to guide the test project
- **C. Make sure the planned test environment is ready to be delivered**
- D. Find, analyze, and remove the causes of the failures highlighted by the tests

Answer: C

Explanation:

A test task that usually occurs during test implementation is to make sure the planned test environment is ready to be delivered. The test environment is the hardware and software configuration on which the tests are executed, and it should be as close as possible to the production environment where the software system will operate. The test environment should be planned, prepared, and verified before the test execution, to ensure that the test conditions, the test data, the test tools, and the test interfaces are available and functional. The other options are not test tasks that usually occur during test implementation, but rather test tasks that occur during

other test activities, such as:

* Find, analyze, and remove the causes of the failures highlighted by the tests: This is a test task that usually occurs during test analysis and design, which is the activity of analyzing the test basis, designing the test cases, and identifying the test data. During this activity, the testers can use techniques such as root cause analysis, defect prevention, or defect analysis, to find, analyze, and remove the causes of the failures highlighted by the previous tests, and to prevent or reduce the occurrence of similar failures in the future tests.

* Archive the testware for use in future test projects: This is a test task that usually occurs during test closure, which is the activity of finalizing and reporting the test results, evaluating the test process, and identifying the test improvement actions. During this activity, the testers can archive the testware, which are the test artifacts produced during the testing process, such as the test plan, the test cases, the test data, the test results, the defect reports, etc., for use in future test projects, such as regression testing, maintenance testing, or reuse testing.

* Gather the metrics that are used to guide the test project: This is a test task that usually occurs during test monitoring and control, which is the activity of tracking and reviewing the test progress, status, and quality, and taking corrective actions when necessary. During this activity, the testers can gather the metrics, which are the measurements of the testing process, such as the test coverage, the defect density, the test effort, the test duration, etc., that are used to guide the test project, such as planning, estimating, scheduling, reporting, or improving the testing process. NEW QUESTION # 97

Which ONE of the following elements is TYPICALLY used to guide testing during exploratory testing?

- A. A predefined test case that must be executed exactly as documented.
- **B. A test charter that defines the testing objectives for the test session.**
- C. A comprehensive specification that must be fully available before testing begins.
- D. A detailed test script that prescribes all the steps to be performed.

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation: Exploratory testing is an unscripted approach where testers actively design and execute tests based on their intuition, experience, and knowledge of the system. A test charter (A) provides a guideline on what areas to explore, defining test objectives but leaving room for dynamic adaptation.

* (B), (C), and (D) contradict exploratory testing principles, which focus on freedom rather than rigid documentation.

* Exploratory testing is especially useful in agile environments, usability testing, and uncovering unexpected defects.

NEW QUESTION # 98

During iteration planning, a scrum team uses an estimation technique called planning poker to estimate the effort required to deliver a critical user story. In advance of the estimation session, the team agreed on some ground rules to limit the number of poker rounds and save time.

The team agreed on the following:

1. They will use the following progression for estimation: Extra-small, Small, Medium, Large, Extra-large, and Extra-extra-large.
2. If estimation values differ significantly, the highest score will be used for estimation purposes.

The result of the first round of planning poker:

Team Member Estimation

Business Large

Development Extra-extra-large

Testing Extra-extra-large

Which of the following options best represent the team's next actions?

- A. The pre-agreed rules state that the highest score should be used for estimation, resulting in the user story being categorised as Extra-extra-large.
- **B. the team discusses the differences in the estimates and repeats the poker round until an agreement is reached.**
- C. Since the business representative is likely to have the most informed view of the requirement, the user story is categorised as a Large.
- D. The fact that all estimations are high indicate that the user story is not well understood or should be broken down into multiple smaller stories.

Answer: B

Explanation:

In a planning poker session, if there is a significant difference in the estimations, it indicates that there may be misunderstandings or different perspectives on the complexity of the user story. According to the agile principles, the team should discuss these differences to reach a common understanding. The goal is to ensure that all team members have a shared understanding of the user story's scope and complexity before finalizing the estimate.

NEW QUESTION # 99

The following chart represents metrics related to testing of a project that was completed. Indicate what is represented by tie lines A, B and the axes X.Y

- A. X - Time
Y - Cost
A - Cost of test (per week)
B - Cost of finding a single bug (per week)
- **B. X - Time
Y - Count
A - Total number of executed tests
B - Number of open bugs**
- C. X - Time
Y - Percent
A - % of functional tests in the test suite
B - % of non-functional tests in the test suite

X - Time
 Y - Number of defects
 A - Number of open defects
 B - Number of closed defects

- D.

Answer: B

Explanation:

Option D correctly explains what is represented by the lines A, B and the axes X, Y in a testing metrics chart.

According to option D:

- * X-axis represents Time
- * Y-axis represents Count
- * Line A represents Number of open bugs
- * Line B represents Total number of executed tests

This information is essential in understanding and analyzing the testing metrics of a completed project.
