

100% Pass Quiz Ping Identity - PAP-001 - Updated Certified Professional - PingAccess Certification Dumps

It is easy for you to pass the exam because you only need 20-30 hours to learn and prepare for the exam. You may worry there is little time for you to learn the PAP-001 Study Tool and prepare the exam because you have spent your main time and energy on your most important thing such as the job and the learning and can't spare too much time to learn. But if you buy our Certified Professional - PingAccess test torrent you only need 1-2 hours to learn and prepare the exam and focus your main attention on your most important thing.

Ping Identity PAP-001 Exam Syllabus Topics:

Topic	Details
Topic 1	• Policies and Rules: This section of the exam measures the skills of Security Administrators and focuses on how PingAccess evaluates paths for applying policies and resources. It covers the role of different rule types, their configuration, and the implementation of rule sets and rule set groups for consistent policy enforcement.
Topic 2	• Installation and Initial Configuration: This section of the exam measures skills of System Engineers and reviews installation prerequisites, methods of installing or removing PingAccess, and securing configuration database passwords. It explains the role of run.properties entries and outlines how to set up a basic on-premise PingAccess cluster.
Topic 3	• Integrations: This section of the exam measures skills of System Engineers and explains how PingAccess integrates with token providers, OAuth and OpenID Connect configurations, and site authenticators. It also includes the use of agents and securing web, API, and combined applications through appropriate integration settings.
Topic 4	• General Maintenance and File System: This section of the exam measures the skills of System Engineers and addresses maintenance tasks such as license management, backups, configuration imports or exports, auditing, and product upgrades. It also includes the purpose of log files and an overview of the PingAccess file system structure with important configuration files.

Topic 5	• Product Overview: This section of the exam measures skills of Security Administrators and focuses on understanding PingAccess features, functionality, and its primary use cases. It also covers how PingAccess integrates with other Ping products to support secure access management solutions.

Valid Ping Identity PAP-001 Learning Materials & Pass4sure PAP-001 Dumps Pdf

The price for PAP-001 study materials is convenient, and no matter you are a student or an employee, you can afford the expense. Moreover, PAP-001 exam materials are high-quality, and you can pass your exam just one time by using them. We offer you free demo to have a try before buying PAP-001 exam materials, and you can have a try before purchasing, so that you can have a better understanding of what you are going to buy. We are pass guarantee and money back guarantee if you fail to pass the exam. We have online and offline service, if you have any questions for PAP-001 Exam Dumps, you can contact us, we will give you reply as soon as possible.

Ping Identity Certified Professional - PingAccess Sample Questions (Q49-Q54):

NEW QUESTION # 49

According to a new business requirement, critical applications require dual-factor authentication when specific resources are accessed in those applications. Which configuration object should the administrator use in the applications?

- A. Auth Token Management
- B. UI Authentication
- C. Authentication Challenge Policy
- **D. Authentication Requirements**

Answer: D

Explanation:

PingAccess enforces step-up or multi-factor authentication using Authentication Requirements, which can be applied to specific resources within an application.

Exact Extract:

"Authentication requirements allow administrators to configure additional authentication (for example, MFA) when accessing sensitive application resources."

* Option A (UI Authentication) applies to access to the admin console, not application resources.

* Option B (Auth Token Management) relates to OAuth token lifetimes and refresh, not MFA enforcement.

* Option C (Authentication Requirements) is correct - these rules enforce MFA or step-up auth for specific URLs/resources.

* Option D (Authentication Challenge Policy) governs how failed auth challenges are presented but does not enforce MFA.

Reference: PingAccess Administration Guide - Authentication Requirements

NEW QUESTION # 50

Developers report an issue with an application that is protected by PingAccess. Certain requests are not providing claims that are part of the access token.

What should the administrator add for the access token claims?

- A. An authentication requirement definition
- B. An identity mapping definition
- C. A web session attribute rule
- **D. An OAuth attribute rule**

Answer: D

Explanation:

In PingAccess, when an application relies on claims from an OAuth access token, you must configure PingAccess to evaluate those

claims and potentially inject them into headers for the backend application.

* Exact Extract from PingAccess documentation:

"OAuth rules allow you to evaluate claims in OAuth access tokens. You can configure PingAccess to look at specific claims and enforce policies or pass them to target applications."

"To extract attributes from an access token, configure an OAuth Attribute Rule." This clearly matches option D.

Analysis of each option:

* A. An authentication requirement definition

* Incorrect. Authentication requirements determine how users authenticate to applications (OIDC provider, etc.), but do not manage access token claims.

* B. A web session attribute rule

* Incorrect. Web session attribute rules map attributes from the authenticated user's web session (SSO session), not from OAuth access tokens.

* C. An identity mapping definition

* Incorrect. Identity mappings transform user attributes (from IdP to app), but they don't directly pull claims from OAuth tokens.

* D. An OAuth attribute rule

* Correct. This rule is specifically designed to extract and enforce policies on claims from OAuth access tokens.

Therefore, the correct answer is D. An OAuth attribute rule.

Reference: PingAccess Administration Guide - Rules # OAuth Attribute Rules.

NEW QUESTION # 51

An organization has a highly available PingAccess cluster with four runtime nodes. The administrator wants to provide the same availability to administrative users. What should the administrator do?

- A. Configure one active and one replica administrative node with engine cluster pointed to both administrative nodes
- B. Configure two active administrative nodes with engine cluster pointed to both administrative nodes for configuration
- C. Configure four active administrative nodes with engine cluster pointed to all administrative nodes for configuration
- **D. Configure one active and three replica administrative nodes with engine cluster pointed to all administrative nodes**

Answer: D

Explanation:

PingAccess supports one primary administrative console (active) and any number of replica administrative consoles. Engines must be configured to connect to the active console, with replicas available for failover.

Exact Extract:

"In a clustered environment, PingAccess supports one clustered console (active) and replica consoles. Engines can connect to any console node for high availability."

* Option A is incomplete - only one replica limits redundancy.

* Option B is incorrect - multiple active consoles are not supported.

* Option C is incorrect - cannot run two active consoles.

* Option D is correct - one active admin console with multiple replicas ensures HA.

Reference: PingAccess Administration Guide - Clustered Console and Replica Configuration

NEW QUESTION # 52

An administrator configures PingAccess to use PingFederate as the token provider. Which benefit does this provide?

- A. The ability to define new OAuth clients in PingFederate from within PingAccess
- B. The ability to manage token issuance criteria from within PingAccess
- **C. The automatic population of the Client ID field for selection in creating or editing a Web Session**
- D. The ability to use Single Sign-On support for the administrative console and OAuth for Admin API

Answer: C

Explanation:

When PingAccess is integrated with PingFederate as a Token Provider, the OAuth clients already configured in PingFederate become available in PingAccess. This enables administrators to automatically select Client IDs when creating Web Sessions.

Exact Extract:

"When PingAccess uses PingFederate as its token provider, PingFederate OAuth clients appear automatically in PingAccess for selection during web session configuration."

* Option A is incorrect - this refers to Admin Console authentication, which is separate.

- * Option B is incorrect - OAuth clients must be created in PingFederate, not from within PingAccess.
 - * Option C is incorrect - token issuance policies are managed in PingFederate, not PingAccess.
 - * Option D is correct - the Client ID dropdown is populated automatically from PingFederate.
- Reference: PingAccess Administration Guide - Token Provider Configuration

NEW QUESTION # 53

An administrator needs to support SLO (Single Logout) for a protected web application. What must be configured in a PingAccess Web Session in this situation?

- A. Idle timeout
- **B. SLO scope**
- C. Validate Session
- D. Refresh User Attributes

Answer: B

Explanation:

To enable Single Logout (SLO), the SLO scope must be defined in the PingAccess Web Session configuration. This determines which sessions are ended when a logout request occurs.

Exact Extract:

"The SLO scope option in a web session specifies which applications are included in a logout event when Single Logout is triggered."

* Option A (SLO scope) is correct; it explicitly enables SLO support by linking session termination across apps.

* Option B (Idle timeout) is unrelated; this controls session expiration, not SLO.

* Option C (Validate Session) ensures session state is synchronized but does not configure SLO.

* Option D (Refresh User Attributes) is unrelated; it only controls whether attributes are reloaded.
