For the convenience of customers, we have designed MuleSoft-Integration-Associate pdf dumps, desktop Salesforce MuleSoft-Integration-Associate practice exam software, and Salesforce MuleSoft-Integration-Associate web-based practice test.

Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q29-Q34):

NEW QUESTION # 29

According to MuleSoft a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. One-way
- **B. Request-Reply**
- C. Batch
- D. Multicast

Answer: B

Explanation:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

* Request-Reply Pattern:

* Definition: This pattern involves a client sending a request to a server and waiting for a reply.

The communication is synchronous, meaning the client waits for the server to process the request and send back the response.

* Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.

* RESTful API and HTTP:

* Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

* Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.

* Example:

* Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

NEW QUESTION # 30

According to MuleSoft which principle is common to both Service Oriented Architecture (SOA) and API-led connectivity approaches*?

- A. Service centralization
- **B. Service reusability**
- C. Service statefulness
- D. Service interdependence

Answer: B

Explanation:

Both Service-Oriented Architecture (SOA) and API-led connectivity emphasize the principle of service reusability. Here's a detailed explanation:

* Service Reusability:

* Definition: Service reusability is the principle where services are designed to be reusable across different applications and use cases.

* SOA: In SOA, services are modular components that can be reused in various business processes, reducing redundancy and

promoting efficient service composition.

* API-led Connectivity: This approach also stresses creating reusable APIs (System APIs, Process APIs, Experience APIs) that can be leveraged across multiple projects and applications.

* Benefits:

* Efficiency: Reduces development time and effort by reusing existing services.

* Consistency: Ensures consistency in business logic and data access across different applications.

* Scalability: Facilitates scaling by using standardized and reusable services/APIs.

NEW QUESTION # 31

An organization's IT team must secure all of the internal APIs within an integration solution by using an API proxy to apply required authentication and authorization policies. Which integration technology, when used for its intended purpose should the team choose to meet these requirements if all other relevant factors are equal?

- **A. API Management (APIM)**
- B. Electronic Data Interchange (EDI)
- C. Robotic Process Automation (RPA)
- D. Integration Platform-as-a-Service (iPaaS)

Answer: A

Explanation:

Securing internal APIs within an integration solution is critical for protecting sensitive data and ensuring proper access controls. The use of API proxies to apply authentication and authorization policies is a best practice in API security. Here's a detailed explanation:

* API Management (APIM):

* Purpose: API Management platforms are designed specifically to manage, secure, and monitor APIs. They provide tools for designing, publishing, securing, and analyzing APIs.

* Key Features:

* Security: APIM platforms offer robust security features such as OAuth, JWT, API keys, and IP whitelisting to authenticate and authorize API consumers.

* API Proxies: They allow the creation of API proxies which act as intermediaries between the client and the backend service. This enables enforcing security policies without modifying the backend API.

* Implementation:

* Authentication and Authorization Policies: Using APIM, the IT team can easily configure policies for authentication (e.g., OAuth 2.0) and authorization to control access to APIs.

* Policy Enforcement: These policies are enforced at the API proxy level, ensuring that only authenticated and authorized requests reach the backend services.

* Monitoring and Analytics: APIM platforms provide detailed analytics and monitoring capabilities to track API usage, detect anomalies, and ensure compliance.

NEW QUESTION # 32

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft integration team adopt to improve delivery quality?

- A. Passive monitoring with Anypoint Monitoring
- B. Continuous design with API Designer
- **C. Automated testing with MUnit**
- D. Manual testing with Anypoint Studio

Answer: C

Explanation:

To improve delivery quality, a key DevOps practice is automated testing. Within the Anypoint Platform, MUnit is the tool specifically designed for this purpose. Here's a step-by-step explanation:

- * Automated Testing:
 - * Definition: Automated testing involves using software tools to execute tests on the application automatically, ensuring that the code works as expected.
 - * Benefits: It increases efficiency, consistency, and coverage of tests, reducing the risk of human error.
 - * MUnit:
 - * Integration Testing: MUnit is MuleSoft's integrated testing framework for applications built with Anypoint Studio. It allows developers to create and run tests for Mule applications, ensuring they function correctly.
 - * Features:
 - * Test Cases: Create comprehensive test cases to validate various parts of the Mule application.
 - * Mocking: Mock external systems and dependencies, enabling isolated testing of application components.
 - * Assertions: Validate the behavior of Mule flows with assertions.
 - * Implementation Steps:
 - * Design Tests: Within Anypoint Studio, design MUnit tests to cover different scenarios and edge cases of the Mule flows.
 - * Run Tests: Execute these tests automatically during the CI/CD pipeline to ensure that new code changes do not break existing functionality.
 - * Continuous Integration: Integrate MUnit tests with CI tools like Jenkins, Bamboo, or GitLab CI for continuous testing.

NEW QUESTION # 33

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- **A. Developing a specification so consumers can test before the implementation is built**
- B. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- C. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- D. Publishing the fully implemented API to Exchange so all developers can reuse the API

Answer: A

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

- * API Specification:
- * Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.
- * Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.
- * Advantages:
- * Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.
- * Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.
- * Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.
