## Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q234-Q239):

### NEW QUESTION # 234

An app team is developing a mobile banking app. It took them two months to create their own APIs to access transaction information from a central database. The app team later found out that another team had already built an API that accesses the transaction information they need.

According to MuleSoft, what organization structure could have saved the app team two months of development time?

- A. MuleSoft Support Center
- **B. Center for Enablement**
- C. Central API Review Board
- D. Center of Excellence

**Answer: B**

Explanation:

Reference:

Center for Enablement is correct answer .It is a cross-functional team typically staffed with members from central IT, line-of-business departments, and digital innovation teams charged with productizing, publishing, and harvesting reusable assets and best practices. In this case , app team would have checked first with Center for Enablement before developing their own API's. Hence could have avoided re-work

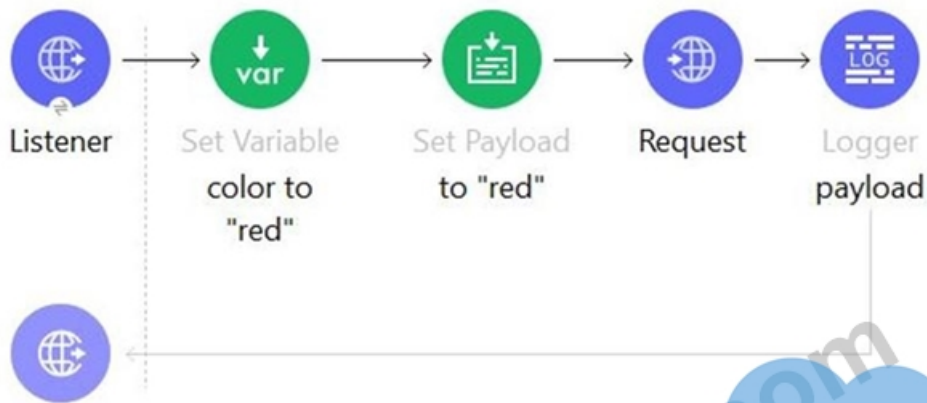

### NEW QUESTION # 235

Refer to the exhibits. In the color flow , both the variable named color and payload are set to "red".

An HTTP POST request is then sent to the decideColor flow's HTTP Listener.

What is the payload value at the Logger component after the HTTP request completes?

#### colorFlow

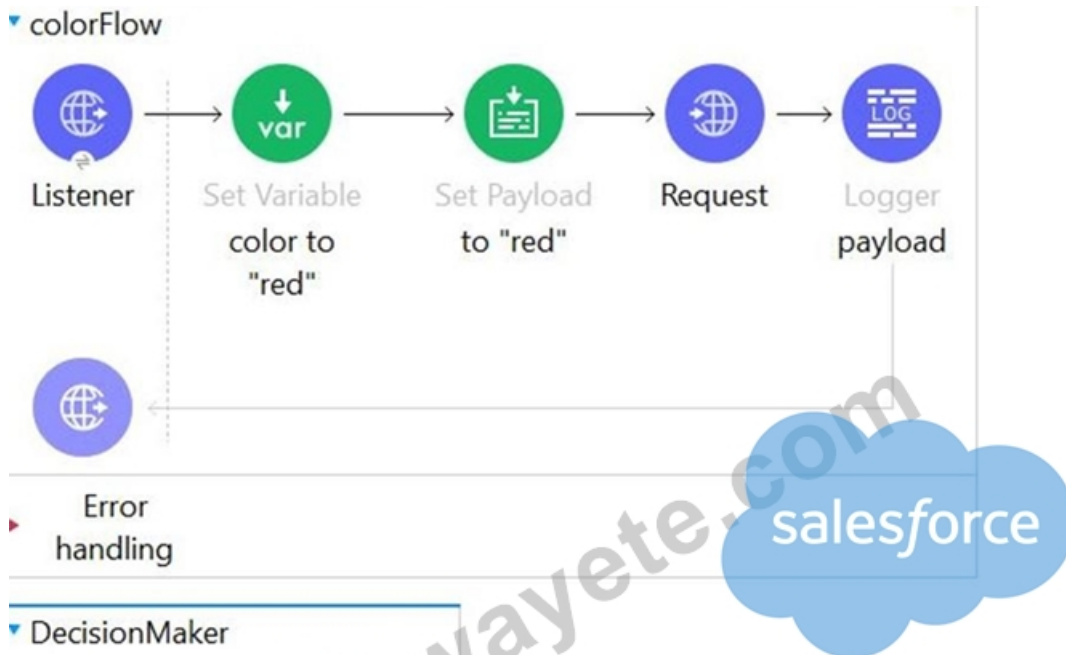

#### Error handling

#### DecisionMaker

  </flow>
```

- A. white
- B. blue
- C. red
- D. Error message

Answer: B

NEW QUESTION # 236

Refer to the exhibits.

The Validation component in the private flow throws an error. What response message is returned to a client request to the main flow's HTTP Listener?

- A. Success - main flow
- B. Validation Error
- C. Error - private flow
- D. Error - main flow

**Answer: D**

Explanation:

Error in validation component will get processed by Processor level On Error Propagate block and then error will be rethrown which will get processed by flow level error handler which will set payload to "Error- main flow". Hence correct answer is Error - main flow

- 1) Request is received by HTTP listener
- 2) Try scope gets executed
- 3) The validator component in the Try scope creates an Error Object because the payload is not null.
- 4) The On Error Propagate handles the error. The payload is set to "Error - Try scope"
- 6) "Error - Try scope" is returned to the 'On Error Continue' block. Main flow execution stops. Payload is set to "Error - main flow"
- 7) "Error - main flow" is returned to the requestor in the body of the HTTP request. HTTP Status Code: 200

----- Reference Diagram though not exactly same, conditions are similar. They will help you answer any new question on error handling in real exam:
