

100% Pass-Rate HPE6-A78 Valid Exam Materials bring you Fast-download Valid HPE6-A78 Test Notes for HP Aruba Certified Network Security Associate Exam

HPE6-A78 Practice Test Questions

Aruba Certified Network Security Associate Exam

What's more, part of that VCE4Dumps HPE6-A78 dumps now are free: <https://drive.google.com/open?id=1uJvtkFRVEkhQQSgDP6w6bIpPMh1mAcd>

You must want to know your scores after finishing exercising our HPE6-A78 study materials, which help you judge your revision. Now, our windows software and online test engine of the HPE6-A78 study materials can meet your requirements. You can choose from two modules: virtual exam and practice exam. Then you are required to answer every question of the HPE6-A78 Study Materials. In order to make sure you have answered all questions, we have answer list to help you check.

HP HPE6-A78 Exam is a computer-based test that consists of 60 multiple-choice questions. Candidates have 90 minutes to complete the exam and must score at least 70% to pass. HPE6-A78 exam is administered through Pearson VUE and can be taken at any of their testing centers worldwide. Once you pass the exam, you will receive an Aruba Certified Network Security Associate certification that is valid for three years. Aruba Certified Network Security Associate Exam certification demonstrates your expertise in network security and can open up new career opportunities in the field.

HP Offers Many Features For HP HPE6-A78 Exam Preparation

Boring learning is out of style. Our HPE6-A78 study materials will stimulate your learning interests. Then you will concentrate on learning our HPE6-A78 practice guide for we have professional experts who have been in this career for over ten year apply the newest technologies to develop not only the content but also the displays. Nothing can divert your attention. If you are ready to change yourself, come to purchase our HPE6-A78 Exam Materials. Never give up your dreams.

HP Aruba Certified Network Security Associate Exam Sample Questions (Q53-Q58):

NEW QUESTION # 53

Which is a correct description of a stage in the Lockheed Martin kill chain?

- A. In the delivery stage, malware collects valuable data and delivers or exfiltrated it to the hacker.
- B. In the exploitation and installation phases, malware creates a backdoor into the infected system for the hacker.
- C. In the reconnaissance stage, the hacker assesses the impact of the attack and how much information was exfiltrated.
- D. In the weaponization stage, which occurs after malware has been delivered to a system, the malware executes its function.

Answer: B

Explanation:

The Lockheed Martin Cyber Kill Chain model describes the stages of a cyber attack. In the exploitation phase, the attacker uses vulnerabilities to gain access to the system. Following this, in the installation phase, the attacker installs a backdoor or other malicious software to ensure persistent access to the compromised system. This backdoor can then be used to control the system, steal data, or execute additional attacks.

Lockheed Martin Cyber Kill Chain framework.

NEW QUESTION # 54

You configure an ArubaOS-Switch to enforce 802.1X authentication with ClearPass Policy Manager (CPPM) defined as the RADIUS server. Clients cannot authenticate. You check Aruba ClearPass Access Tracker and cannot find a record of the authentication attempt.

What are two possible problems that have this symptom? (Select two)

- A. users are logging in with the wrong usernames and passwords or invalid certificates.
- B. Clients are configured to use a mismatched EAP method from the one in the CPPM service.
- **C. The RADIUS shared secret does not match between the switch and CPPM.**
- **D. CPPM does not have a network device defined for the switch's IP address.**
- E. Clients are not configured to trust the root CA certificate for CPPM's RADIUS/EAP certificate.

Answer: C,D

Explanation:

If clients cannot authenticate and there is no record of the authentication attempt in Aruba ClearPass Access Tracker, two possible problems that could cause this symptom are:

The RADIUS shared secret does not match between the switch and CPPM. This mismatch would prevent the switch and CPPM from successfully communicating, so authentication attempts would fail, and no record would appear in Access Tracker.

CPPM does not have a network device profile defined for the switch's IP address. Without a network device profile, CPPM would not recognize authentication attempts coming from the switch and would not process them, resulting in no logs in Access Tracker.

The other options are incorrect because:

Users logging in with the wrong credentials would still generate an attempt record in Access Tracker.

Clients configured to use a mismatched EAP method would also generate an attempt record in Access Tracker.

Clients not configured to trust the root CA certificate for CPPM's RADIUS/EAP certificate might fail authentication, but the attempt would still be logged in Access Tracker.

NEW QUESTION # 55

What is a benefit of Protected Management Frames (PMF), sometimes called Management Frame Protection (MFP)?

- A. PMF prevents hackers from capturing the traffic between APs and Mobility Controllers.
- B. PMF helps to protect APs and MCs from unauthorized management access by hackers.
- C. PMF ensures that traffic between APs and Mobility Controllers (MCs) is encrypted.
- **D. PMF protects clients from DoS attacks based on forged de-authentication frames**

Answer: D

Explanation:

Protected Management Frames (PMF), also known as Management Frame Protection (MFP), is designed to protect clients from denial-of-service (DoS) attacks that involve forged de-authentication and disassociation frames. These attacks can disconnect legitimate clients from the network. PMF provides a way to authenticate these management frames, ensuring that they are not forged, thus enhancing the security of the wireless network.

:

IEEE 802.11w amendment, which introduces PMF as a security enhancement to protect management frames.

Wi-Fi Alliance security guidelines for Protected Management Frames (PMF).

NEW QUESTION # 56

You are managing an Aruba Mobility Controller (MC). What is a reason for adding a "Log Settings" definition in the ArubaOS Diagnostics > System > Log Settings page?

- A. Configuring the Syslog server settings for the server to which the MC forwards logs for a particular category and level
- B. Configuring the MC to generate logs for a particular event category and level, but only for a specific user or AP.
- C. Configuring a filter that you can apply to a defined Syslog server in order to filter events by subcategory
- D. Configuring the log facility and log format that the MC will use for forwarding logs to all Syslog servers

Answer: A

NEW QUESTION # 57

Refer to the exhibit.

The screenshot shows a 'System Event Details' window with the following data:

System Event Details	
Source	RADIUS
Level	ERROR
Category	Authentication
Action	Unknown
Timestamp	FEB 06, 2020 04:41:51 EST
Description	RADIUS authentication attempt from unknown NAD 10.1.10.8:1812

You are deploying a new ArubaOS Mobility Controller (MC), which is enforcing authentication to Aruba ClearPass Policy Manager (CPPM). The authentication is not working correctly, and you find the error shown in the exhibit in the CPPM Event Viewer. What should you check?

- A. that the MC has been added as a domain machine on the Active Directory domain with which CPPM is synchronized
- B. that the MC has valid admin credentials configured on it for logging into the CPPM
- C. that the snared secret configured for the CPPM authentication server matches the one defined for the device on CPPM
- D. that the IP address that the MC is using to reach CPPM matches the one defined for the device on CPPM

Answer: D

Explanation:

Given the error message from the ClearPass Policy Manager (CPPM) Event Viewer, indicating a RADIUS authentication attempt from an unknown Network Access Device (NAD), you should check that the IP address the Mobility Controller (MC) is using to communicate with CPPM matches the IP address defined for the MC in the CPPM's device inventory. If there is a mismatch in IP addresses, CPPM will not recognize the MC as a known device and will not process the authentication request, leading to the error observed.
