## Pass Workday-Pro-Integrations Exam, Fresh Workday-Pro-Integrations Dumps

We have applied the latest technologies to the design of our Workday-Pro-Integrations test prep not only on the content but also on the displays. As a consequence you are able to keep pace with the changeable world and remain your advantages with our Workday-Pro-Integrations training materials. Besides, you can consolidate important knowledge for you personally and design customized study schedule or to-do list on a daily basis. The last but not least, our after-sales service can be the most attractive project in our Workday-Pro-Integrations Guide Torrent.

## Workday Pro Integrations Certification Exam Sample Questions (Q35-Q40):

### NEW QUESTION # 35

Refer to the following scenario to answer the question below. Your integration has the following runs in the integration events report (Date format of MM/DD/YYYY):

Run #1

\* Core Connector: Worker Integration System was launched on May 15, 2024 at 3:00:00 AM.

- \* As of Entry Moment: 05/15/2024 3:00:00 AM
- \* Effective Date: 05/15/2024
- \* Last Successful As of Entry Moment: 05/01/2024 3:00:00 AM
- \* Last Successful Effective Date: 05/01/2024

Run #2

- \* Core Connector: Worker Integration System was launched on May 31, 2024 at 3:00:00 AM.
- \* As of Entry Moment: 05/31/2024 3:00:00 AM
- \* Effective Date: 05/31/2024
- \* Last Successful As of Entry Moment: 05/15/2024 3:00:00 AM
- \* Last Successful Effective Date: 05/15/2024 On May 13, 2024 Brian Hill receives a salary increase. The new salary amount is set to \$90,000.00 with an effective date of April 30, 2024. Which of these runs will include Brian Hill's compensation change?

- A. Brian Hill will only be included in the second integration run.
- B. Brian Hill will only be included in the first integration run.
- **C. Brian Hill will be excluded from both integration runs.**
- D. Brian Hill will be included in both integration runs.

**Answer: C**

Explanation:

The scenario involves a Core Connector: Worker integration with two runs detailed in the integration events report. The goal is to determine whether Brian Hill's compensation change, effective April 30, 2024, and entered on May 13, 2024, will be included in either of the runs based on their date launch parameters. Let's analyze each run against the change details to identify the correct answer.

In Workday, the Core Connector: Worker integration in incremental mode (as indicated by the presence of "Last Successful" parameters) processes changes based on the Transaction Log, filtering them by the Entry Moment (when the change was entered) and Effective Date (when the change takes effect). The integration captures changes where:

- \* The Entry Moment falls between the Last Successful As of Entry Moment and the As of Entry Moment, and
- \* The Effective Date falls between the Last Successful Effective Date and the Effective Date.

Brian Hill's compensation change has:

- \* Entry Moment: 05/13/2024 (time not specified, so we assume it occurs at some point during the day, before or up to 11:59:59 PM).
- \* Effective Date: 04/30/2024.

Analysis of Run #1

- \* Launch Date: 05/15/2024 at 3:00:00 AM
- \* As of Entry Moment: 05/15/2024 3:00:00 AM - The latest point for when changes were entered.
- \* Effective Date: 05/15/2024 - The latest effective date for changes.
- \* Last Successful As of Entry Moment: 05/01/2024 3:00:00 AM - The starting point for entry moments.
- \* Last Successful Effective Date: 05/01/2024 - The starting point for effective dates.

For Run #1 to include Brian's change:

- \* The Entry Moment (05/13/2024) must be between 05/01/2024 3:00:00 AM and 05/15/2024 3:00:00 AM. Since 05/13/2024 falls within this range (assuming the change was entered before 3:00:00 AM on 05/15/2024, which is reasonable unless specified otherwise), this condition is met.

- \* The Effective Date (04/30/2024) must be between 05/01/2024 (Last Successful Effective Date) and 05/15/2024 (Effective Date). However, 04/30/2024 is before 05/01/2024, so this condition is not met.

Since the effective date of Brian's change (04/30/2024) precedes the Last Successful Effective Date (05/01/2024), Run #1 will not include this change. In incremental mode, Workday excludes changes with effective dates prior to the last successful effective date, as those are assumed to have been processed in a prior run (before Run #1's baseline of 05/01/2024).

Analysis of Run #2

- \* Launch Date: 05/31/2024 at 3:00:00 AM
- \* As of Entry Moment: 05/31/2024 3:00:00 AM - The latest point for when changes were entered.
- \* Effective Date: 05/31/2024 - The latest effective date for changes.
- \* Last Successful As of Entry Moment: 05/15/2024 3:00:00 AM - The starting point for entry moments.
- \* Last Successful Effective Date: 05/15/2024 - The starting point for effective dates.

For Run #2 to include Brian's change:

- \* The Entry Moment (05/13/2024) must be between 05/15/2024 3:00:00 AM and 05/31/2024 3:00:00 AM. However, 05/13/2024 is before 05/15/2024 3:00:00 AM, so this condition is not met.

- \* The Effective Date (04/30/2024) must be between 05/15/2024 (Last Successful Effective Date) and 05/31/2024 (Effective Date). Since 04/30/2024 is before 05/15/2024, this condition is also not met.

In Run #2, the Entry Moment (05/13/2024) precedes the Last Successful As of Entry Moment (05/15/2024 3:00:00 AM), meaning the change was entered before the starting point of this run's detection window.

Additionally, the Effective Date(04/30/2024) is well before the Last Successful Effective Date(05/15/2024).

Both filters exclude Brian's change from Run #2.

Conclusion

\* Run #1: Excluded because the effective date (04/30/2024) is before the Last Successful Effective Date (05/01/2024).

\* Run #2: Excluded because the entry moment (05/13/2024) is before the Last Successful As of Entry Moment (05/15/2024 3:00:00 AM) and the effective date (04/30/2024) is before the Last Successful Effective Date (05/15/2024).

Brian Hill's change would have been processed in an earlier run (prior to May 1, 2024) if the integration was running incrementally before Run #1, as its effective date (04/30/2024) predates both runs' baselines. Given the parameters provided, neither Run #1 nor Run #2 captures this change, making D. Brian Hill will be excluded from both integration runs the correct answer.

Workday Pro Integrations Study Guide References

\* Workday Integrations Study Guide: Core Connector: Worker- Section on "Incremental Processing" explains how changes are filtered based on entry moments and effective dates relative to the last successful run.

\* Workday Integrations Study Guide: Launch Parameters- Details how "Last Successful As of Entry Moment" and "Last Successful Effective Date" define the starting point for detecting new changes, excluding prior transactions.

\* Workday Integrations Study Guide: Change Detection- Notes that changes with effective dates before the last successful effective date are assumed processed in earlier runs and are skipped in incremental mode.

## NEW QUESTION # 36

Refer to the following XML to answer the question below.

Refer to the following XML to answer the question below.

```
1. <wd:Get_Job_Profiles_Response xmlns:wd="urn:com.workday/bsvc" wd:version="v43.0">
2.   <wd:Response_Data>
3.     <wd:Job_Profile>

29.      </wd:Job_Profile>
30.    </wd:Response_Data>
31.  </wd:Get_Job_Profiles_Response>
```

You are an integration developer and need to write XSLT to transform the output of an EIB which is making a request to the Get Job Profiles web service operation. The root template of your XSLT matches on the <wd: Get\_Job\_Profiles\_Response> element. This root template then applies templates against <wd:Job\_Profile>.

XPath contains a number of delivered functions such as format-date. The format-date function uses the following syntax: format-date (\$value as xs:date? \$picture as xs:string). Within the template which matches on <wd:Job\_Profile>, what XPath syntax would you use to output the value of the <wd:Effective\_Date> element formatted with the day-month-year format of "15-07-2024"?

- A. format-date (wd:Job\_Profile\_Data/wd:Effective\_Date, '[D01]-[M01]-[Y0001]')
- B. format-date('[M01]-[D01]-[Y0001]', wd:Job\_Profile\_Data/wd:Effective\_Date)
- C. format-date('[D01]-[M01]-[Y0001]', wd:Job\_Profile\_Data/wd:Effective\_Date)
- D. format-date (wd:Job\_Profile\_Data/wd:Effective\_Date, '[M01]-[D01]-[Y0001]')

**Answer: A**

## Explanation:

As an integration developer working with Workday, you are tasked with transforming the output of an Enterprise Interface Builder (EIB) that calls the Get\_Job\_Profiles web service operation. The XML provided shows the response from this operation, and you need to write XSLT to format the <wd:Effective\_Date> element within the <wd:Job\_Profile\_Data> section. Specifically, you need to output the date "2024-05-15" (as seen in the XML) in the format "15-07-2024" (day-month-year). The root template of your XSLT matches on

<wd:Get\_Job\_Profiles\_Response> and applies templates to <wd:Job\_Profile>. You are using the format-date XPath function, which follows the syntax: format-date(\$value as xs:date?, \$picture as xs:string). Let's analyze the XML, the requirement, and each option to determine the correct XPath syntax.

### Understanding the XML and Requirement

The provided XML snippet shows a response from the Get\_Job\_Profiles web service operation in Workday, formatted in SOAP XML with the Workday namespace (xmlns:wd="urn:com.workday/bsvc"). Key elements relevant to the question include:

- \* The root element is <wd:Get\_Job\_Profiles\_Response>.
- \* It contains <wd:Response\_Data>, which includes <wd:Job\_Profile> elements.
- \* Within <wd:Job\_Profile>, there is <wd:Job\_Profile\_Data>, which contains <wd:Effective\_Date> with the value 2024-05-15.
- \* You need to transform this date into the format "15-07-2024" (DD-MM-YYYY), where:
- \* "15" is the day (D01 for two digits).
- \* "07" is the month (M01 for two digits, noting the XML shows May, but the question specifies July for the output format-likely a hypothetical or test case adjustment).
- \* "2024" is the year (Y0001 for four digits).

The format-date function in XPath 2.0 (used by Workday) formats a date value according to a picture string.

The syntax is:

- \* First parameter: The date value (e.g., wd:Job\_Profile\_Data/wd:Effective\_Date), which must be an xs:date or convertible to one.
- \* Second parameter: The picture string (e.g., '[D01]-[M01]-[Y0001]'), specifying the format using patterns like:
  - \* [D01] for two-digit day (01-31).
  - \* [M01] for two-digit month (01-12).
  - \* [Y0001] for four-digit year (e.g., 2024).

The question specifies that the root template matches <wd:Get\_Job\_Profiles\_Response> and applies templates to <wd:Job\_Profile>, so the XPath must navigate to <wd:Job\_Profile\_Data/wd:Effective\_Date> within that context.

### Analysis of Options

Let's evaluate each option based on the format-date syntax, the XML structure, and the required output format "15-07-2024":

- \* Option A: format-date('[D01]-[M01]-[Y0001]', wd:Job\_Profile\_Data/wd:Effective\_Date)
  - \* This option places the picture string ('[D01]-[M01]-[Y0001]') as the first parameter and the date value (wd:Job\_Profile\_Data/wd:Effective\_Date) as the second. However, the format-date function requires the date value as the first parameter and the picture string as the second, per the syntax format-date(\$value, \$picture). Reversing the parameters is incorrect and will result in an error or unexpected output, as format-date expects an xs:date? first. Thus, this option is invalid.
- \* Option B: format-date (wd:Job\_Profile\_Data/wd:Effective\_Date, '[D01]-[M01]-[Y0001]')
  - \* This option correctly follows the format-date syntax:

\* First parameter: wd:Job\_Profile\_Data/wd:Effective\_Date, which points to the <wd:Effective\_Date> element in the XML (e.g., 2024-05-15). This is an xs:date value, as Workday web services typically return dates in ISO format (YYYY-MM-DD), which format-date can process.

- \* Second parameter: '[D01]-[M01]-[Y0001]', which specifies the output format:
  - \* [D01] outputs the day as two digits (e.g., "15").
  - \* [M01] outputs the month as two digits (e.g., "05" for May, but the question requests "07" for July-assuming a test case adjustment or hypothetical transformation).
  - \* [Y0001] outputs the year as four digits (e.g., "2024").

\* The XPath wd:Job\_Profile\_Data/wd:Effective\_Date is correctly nested under the <wd:Job\_Profile> context, as the template matches on <wd:Job\_Profile>. This would transform "2024-05-15" into "15-05-2024" (or "15-07-2024" if the month is adjusted in the logic), matching the required day-month-year format. This option is valid and correct.

- \* Option C: format-date (wd:Job\_Profile\_Data/wd:Effective\_Date, '[M01]-[D01]-[Y0001]')
  - \* This option also follows the correct format-date syntax, with the date value first and the picture string second. However, the picture string '[M01]-[D01]-[Y0001]' specifies a month-day-year format:
    - \* [M01] outputs the month first (e.g., "05" for May).
    - \* [D01] outputs the day second (e.g., "15").
    - \* [Y0001] outputs the year last (e.g., "2024").

\* This would transform "2024-05-15" into "05-15-2024," which does not match the required "15-07-2024" (day-month-year) format. Thus, this option is incorrect for the specified output.

- \* Option D: format-date('[M01]-[D01]-[Y0001]', wd:Job\_Profile\_Data/wd:Effective\_Date)

\* Similar to Option A, this option reverses the parameters, placing the picture string ('[M01]-[D01]-[Y0001]') first and the date value (wd:Job\_Profile\_Data/wd:Effective\_Date) second. As explained earlier, format-date requires the date value as the first parameter, so this syntax is incorrect and will not work as intended. This option is invalid.

Why Option B is Correct

Option B correctly uses the format-date function with the proper syntax:

\* It places the date value (wd:Job\_Profile\_Data/wd:Effective\_Date) as the first parameter, referencing the <wd:Effective\_Date> element in the XML.

\* It uses the picture string '[D01]-[M01]-[Y0001]' as the second parameter, which formats the date as "DD-MM-YYYY" (e.g., "15-05-2024" for the XML's "2024-05-15," or "15-07-2024" as specified, assuming a month adjustment in the transformation logic).

\* The XPath is appropriate for the context, as the template matches <wd:Job\_Profile>, and <wd:Job\_Profile\_Data/wd:Effective\_Date> is a valid path within it.

The question's mention of "15-07-2024" suggests either a hypothetical adjustment (e.g., the EIB or XSLT logic modifies the month to July) or a test case variation. Since the XML shows "2024-05-15," the format- date function would output "15-05-2024" with the given picture string, but the principle of formatting day- month-year remains correct. Workday's XSLT implementation supports such transformations, and the format- date function is well-documented for this purpose.

Practical Example in XSLT

Here's how this might look in your XSLT:

```
<xsl:template match="wd:Job_Profile">
  <xsl:value-of select="format-date(wd:Job_Profile_Data/wd:Effective_Date, '[D01]-[M01]-[Y0001]')"/>
</xsl:template>
```

This would process the <wd:Effective\_Date> (e.g., "2024-05-15") and output "15-05-2024," aligning with the day-month-year format requested (adjusted for the hypothetical "07" if needed elsewhere in the logic).

Verification with Workday Documentation

The Workday Pro Integrations Study Guide and SOAP API Reference (available via Workday Community) detail the use of XPath functions like format-date for transforming web service responses. The Get\_Job\_Profiles operation returns job profile data, including effective dates, in ISO format, and XSLT transformations are commonly used in EIBs to reformat data. The format-date function's syntax and picture string patterns (e.g., [D01], [M01], [Y0001]) are standard in XPath 2.0, as implemented in Workday's integration tools.

Workday Pro Integrations Study Guide References

\* Section: XSLT Transformations in EIBs- Describes using XSLT to transform web service responses, including date formatting with format-date.

\* Section: Workday Web Services- Details the Get\_Job\_Profiles operation and its XML output structure, including <wd:Effective\_Date>.

\* Section: XPath Functions- Explains the syntax and usage of format-date(\$value, \$picture), including picture string patterns like [D01], [M01], and [Y0001].

\* Workday Community SOAP API Reference - Provides examples of date formatting in XSLT for Workday web services.

Option B is the verified answer, as it correctly applies the format-date function to format the <wd:Effective\_Date> in the required day-month-year format.

## NEW QUESTION # 37

Refer to the following scenario to answer the question below.

You have been asked to build an integration using the Core Connector: Worker template and should leverage the Data Initialization Service (DIS). The integration will be used to export a full file (no change detection) for employees only and will include personal data.

What configuration is required to output the value of a calculated field which you created for inclusion in this integration?

- A. Configure Integration Field Overrides.
- B. Configure Integration Field Attributes.
- C. Configure Integration Maps.
- D. Configure Integration Attributes.

**Answer: A**

Explanation:

The scenario involves a Core Connector: Worker integration using the Data Initialization Service (DIS) to export a full file of employee personal data, with a requirement to include a calculated field in the output.

Core Connectors rely on predefined field mappings, but custom calculated fields need specific configuration to be included. Let's analyze the solution:

\* Requirement:Output the value of a calculated field created for this integration. In Workday, calculated fields are custom-built (e.g.,

using Report Writer or Calculated Fields) and not part of the standard Core Connector template, so they must be explicitly added to the output.

\* Integration Field Overrides: In Core Connectors, Integration Field Overrides allow you to replace a delivered field's value or add a new field to the output by mapping it to a calculated field. This is the standard method to include custom calculated fields in the integration file. You create the calculated field separately, then use overrides to specify where its value appears in the output structure (e.g., as a new column or replacing an existing field).

\* Option Analysis:

\* A. Configure Integration Field Attributes: Incorrect. Integration Field Attributes refine how delivered fields are output (e.g., filtering multi-instance data like phone type), but they don't support adding or mapping calculated fields.

\* B. Configure Integration Field Overrides: Correct. This configuration maps the calculated field to the output, ensuring its value is included in the exported file.

\* C. Configure Integration Attributes: Incorrect. Integration Attributes define integration-level settings (e.g., file name, delivery protocol), not field-specific outputs like calculated fields.

\* D. Configure Integration Maps: Incorrect. Integration Maps transform existing field values (e.g., "Married" to "M"), but they don't add new fields or directly output calculated fields.

\* Implementation:

\* Create the calculated field in Workday (e.g., via Create Calculated Field task).

\* Edit the Core Connector: Worker integration.

\* Navigate to the Integration Field Overrides section.

\* Add a new override, selecting the calculated field and specifying its output position (e.g., a new field ID or overriding an existing one).

\* Test the integration to confirm the calculated field value appears in the output file.

References from Workday Pro Integrations Study Guide:

\* Core Connectors & Document Transformation: Section on "Configuring Integration Field Overrides" explains how to include calculated fields in Core Connector outputs.

\* Integration System Fundamentals: Notes the use of overrides for custom data in predefined integration templates.

## NEW QUESTION # 38

Refer to the following XML to answer the question below.

```
1. <wd:Get_Job_Profiles_Response xmlns:wd="urn:com.workday/bsvc" wd:version="v43.0">
2.   <wd:Response_Data>

25.              <wd:ID wd:type="Degree_ID">B_S</wd:ID>
26.            </wd:Degree_Reference>
27.            <wd:Required>1</wd:Required>
28.          </wd:Education_Qualification_Replacement_Data>
29.        </wd:Job_Profile_Data>
30.      </wd:Job_Profile>
31.    </wd:Response_Data>
32.  </wd:Get_Job_Profiles_Response>
```

You are an integration developer and need to write XSLT to transform the output of an EIB which is making a request to the Get Job Profiles web service operation. The root template of your XSLT matches on the <wd:Get\_Job\_Profiles\_Response> element. This root template then applies templates against <wd:Job\_Profile>.

What XPath syntax would be used to select the value of the ID element which has a wd:type attribute named Job\_Profile\_ID when the <xsl:value-of> element is placed within the template which matches on <wd:Job\_Profile>?

- A. wd:Job\_Profile\_Reference/wd:ID/[@wd:type='Job\_Profile\_ID']
- B. wd:Job\_Profile\_Reference/wd:ID/@wd:type='Job\_Profile\_ID'
- C. wd:Job\_Profile\_Reference/wd:ID/wd:type='Job\_Profile\_ID'
- D. wd:Job\_Profile\_Reference/wd:ID[@wd:type='Job\_Profile\_ID']

**Answer: D**

**Explanation:**

As an integration developer working with Workday, you are tasked with transforming the output of an Enterprise Interface Builder (EIB) that calls the Get\_Job\_Profiles web service operation. The provided XML shows the response from this operation, and you need to write XSLT to select the value of the `<wd:ID>` element where the `wd:type` attribute equals "Job\_Profile\_ID." The root template of your XSLT matches on

`<wd:Get_Job_Profiles_Response>` and applies templates to `<wd:Job_Profile>`. Within this template, you use the `<xsl:value-of>` element to extract the value. Let's analyze the XML structure, the requirement, and each option to determine the correct XPath syntax.

**Understanding the XML and Requirement**

The XML snippet provided is a SOAP response from the Get\_Job\_Profiles web service operation in Workday, using the namespace `xmlns:wd="urn:com:workday:bsvc"` and version `wd:version="v43.0"`. Key elements relevant to the question include:

- \* The root element is `<wd:Get_Job_Profiles_Response>`.
- \* It contains `<wd:Response_Data>`, which includes `<wd:Job_Profile>` elements.
- \* Within `<wd:Job_Profile>`, there is `<wd:Job_Profile_Reference>`, which contains multiple `<wd:ID>` elements, each with a `wd:type` attribute:
- \* `<wd:ID wd:type='WID'>1740d3eca2f2ed9b6174ca7d2ae88c8c</wd:ID>`
- \* `<wd:ID wd:type='Job_Profile_ID'>Senior_Benefits_Analyst</wd:ID>`

The task is to select the value of the `<wd:ID>` element where `wd:type="Job_Profile_ID"` (e.g.,

"Senior\_Benefits\_Analyst") using XPath within an XSLT template that matches `<wd:Job_Profile>`. The `<xsl:value-of>` element outputs the value of the selected node, so you need the correct XPath path from the `<wd:Job_Profile>` context to the specific `<wd:ID>` element with the `wd:type` attribute value "Job\_Profile\_ID."

**Analysis of Options** Let's evaluate each option based on the XML structure and XPath syntax rules:

- \* Option A: `wd:Job_Profile_Reference/wd:ID/wd:type='Job_Profile_ID'`
  - \* This XPath attempts to navigate from `wd:Job_Profile_Reference` to `wd:ID`, then to `wd:type='Job_Profile_ID'`. However, there are several issues:
    - \* `wd:type='Job_Profile_ID'` is not valid XPath syntax. In XPath, to filter based on an attribute value, you use the attribute selector `[@attribute='value']`, not a direct comparison like `wd:type='Job_Profile_ID'`.
    - \* `wd:type` is an attribute of `<wd:ID>`, not a child element or node. This syntax would not select the `<wd:ID>` element itself but would be interpreted as trying to match a nonexistent child node or property, resulting in an error or no match.
    - \* This option is incorrect because it misuses XPath syntax for attribute filtering.
- \* Option B: `wd:Job_Profile_Reference/wd:ID/@wd:type='Job_Profile_ID'`
  - \* This XPath navigates to `wd:Job_Profile_Reference/wd:ID` and then selects the `@wd:type` attribute, comparing it to "Job\_Profile\_ID" with `=@wd:type='Job_Profile_ID'`. However:
    - \* The `=@wd:type='Job_Profile_ID'` syntax is invalid in XPath. To filter based on an attribute value, you use `[@wd:type='Job_Profile_ID']` as a predicate, not an equality comparison in this form.
    - \* This XPath would select the `wd:type` attribute itself (e.g., the string "Job\_Profile\_ID"), not the value of the `<wd:ID>` element. Since `<xsl:value-of>` expects a node or element value, selecting an attribute directly would not yield the desired "Senior\_Benefits\_Analyst" value.
    - \* This option is incorrect due to the invalid syntax and inappropriate selection of the attribute instead of the element value.
- \* Option C: `wd:Job_Profile_Reference/wd:ID[@wd:type='Job_Profile_ID']`
  - \* This XPath navigates from `wd:Job_Profile_Reference` to `wd:ID` and uses the predicate `[@wd:type='Job_Profile_ID']` to filter for `<wd:ID>` elements where the `wd:type` attribute equals "Job\_Profile\_ID."
    - \* In the XML, `<wd:Job_Profile_Reference>` contains:
      - \* `<wd:ID wd:type='WID'>1740d3eca2f2ed9b6174ca7d2ae88c8c</wd:ID>`
      - \* `<wd:ID wd:type='Job_Profile_ID'>Senior_Benefits_Analyst</wd:ID>`
    - \* The predicate `[@wd:type='Job_Profile_ID']` selects the second `<wd:ID>` element, whose value is "Senior\_Benefits\_Analyst."
    - \* Since the template matches `<wd:Job_Profile>`, and `<wd:Job_Profile_Reference>` is a direct child of `<wd:Job_Profile>`, this path is correct:
      - \* `<wd:Job_Profile> # <wd:Job_Profile_Reference> # <wd:ID[@wd:type='Job_Profile_ID']>`.
      - \* When used with `<xsl:value-of select="wd:Job_Profile_Reference/wd:ID[@wd:type='Job_Profile_ID']"/>`, it outputs "Senior\_Benefits\_Analyst," fulfilling the requirement.

- \* This option is correct because it uses proper XPath syntax for attribute-based filtering and selects the desired <wd:ID> value.
- \* Option D: wd:Job\_Profile\_Reference/wd:ID[@wd:type='Job\_Profile\_ID']
- \* This XPath is similar to Option C but includes an extra forward slash before the predicate: wd:ID/[@wd:type='Job\_Profile\_ID']. In XPath, predicates like [@attribute='value'] are used directly after the node name (e.g., wd:ID[@wd:type='Job\_Profile\_ID']), not separated by a slash. The extra slash is syntactically incorrect and would result in an error or no match, as it implies navigating to a child node that doesn't exist.
- \* This option is incorrect due to the invalid syntax.

#### Why Option C is Correct

Option C, wd:Job\_Profile\_Reference/wd:ID[@wd:type='Job\_Profile\_ID'], is the correct XPath syntax because:

- \* It starts from the context node <wd:Job\_Profile> (as the template matches this element) and navigates to <wd:Job\_Profile\_Reference/wd:ID>, using the predicate [@wd:type='Job\_Profile\_ID'] to filter for the <wd:ID> element with wd:type='Job\_Profile\_ID'.
- \* It correctly selects the value "Senior\_Benefits\_Analyst," which is the content of the <wd:ID> element where wd:type='Job\_Profile\_ID'.
- \* It uses standard XPath syntax for attribute-based filtering, aligning with Workday's XSLT implementation for web service responses.
- \* When used with <xsl:value-of>, it outputs the required value, fulfilling the question's requirement.

#### Practical Example in XSLT

Here's how this might look in your XSLT:

```
<xsl:template match="wd:Job_Profile">
<xsl:value-of select="wd:Job_Profile_Reference/wd:ID[@wd:type='Job_Profile_ID']"/>
</xsl:template>
```

This would output "Senior\_Benefits\_Analyst" for the <wd:ID> element with wd:type='Job\_Profile\_ID' in the XML.

#### Verification with Workday Documentation

The Workday Pro Integrations Study Guide and SOAP API Reference (available via Workday Community) detail the structure of the Get\_Job\_Profiles response and how to use XPath in XSLT for transformations. The XML structure shows <wd:Job\_Profile\_Reference> containing <wd:ID> elements with wd:type attributes, and the guide emphasizes using predicates like [@wd:type='value'] to filter based on attributes. This is a standard practice for navigating Workday web service responses.

#### Workday Pro Integrations Study Guide References

- \* Section: XSLT Transformations in EIBs- Describes using XSLT to transform web service responses, including selecting elements with XPath and attribute predicates.
- \* Section: Workday Web Services- Details the Get\_Job\_Profiles operation and its XML output structure, including <wd:Job\_Profile\_Reference> and <wd:ID> with wd:type attributes.
- \* Section: XPath Syntax- Explains how to use predicates like [@wd:type='Job\_Profile\_ID'] for attribute- based filtering in Workday XSLT.
- \* Workday Community SOAP API Reference - Provides examples of XPath navigation for Workday web service responses, including attribute selection.

Option C is the verified answer, as it correctly selects the <wd:ID> value with wd:type='Job\_Profile\_ID' using the appropriate XPath syntax within the <wd:Job\_Profile> template context.

## NEW QUESTION # 39

You need the integration file to generate the date format in the form of "31/07/2025" format

- \* The first segment is day of the month represented by two characters.
- \* The second segment is month of the year represented by two characters.
- \* The last segment is made up of four characters representing the year

How will you use Document Transformation (OT) to do the transformation using XTT?

```
1. <xsl:template match="ps:Position">
2.   <Record>
3.     <Availability_Date>
4.       <xsl:value-of xtt:dateFormat="dd/MM/YYYY"
5.                     select="ps:Position/ps:ps:Availability_Date"/>
6.     </Availability_Date>
7.   </Record>
8. </xsl:template>
```

- A.
- B.

```

1. <xsl:template match="ps:Position">
2.   <Record>  ITCERTKEY <!--/yy/yy" match="ps:Position">
3.     <Availability_Date>
4.       <xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
5.     </Availability_Date>
6.   </Record>
7. </xsl:template>

```

- C.

```

1. <xsl:template match="ps:Position">  ITCERTKEY
2.   <Record> Latest IT Exam training materials
3.     <Availability_Date xtt:dateFormat="dd/MM/yyyy">
4.       <xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
5.     </Availability_Date>
6.   </Record>
7. </xsl:template>

```

- D.

```

1. <xsl:template match="ps:Position">  ITCERTKEY
2.   <Record xtt:dateFormat="dd/MM/yyyy"> Latest IT Exam training materials
3.     <Availability_Date>
4.       <xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
5.     </Availability_Date>
6.   </Record>
7. </xsl:template>

```

## Answer: D

Explanation:

The requirement is to generate a date in "31/07/2025" format (DD/MM/YYYY) using Document Transformation with XSLT, where the day and month are two characters each, and the year is four characters.

The provided options introduce a xtt:dateFormat attribute, which appears to be an XTT-specific extension in Workday for formatting dates without manual string manipulation. XTT (XML Transformation Toolkit) is an enhancement to XSLT in Workday that simplifies transformations via attributes like xtt:dateFormat.

Analysis of Options

Assuming the source date (e.g., ps:Position\_Data/ps:Availability\_Date) is in Workday's ISO 8601 format (YYYY-MM-DD, e.g., "2025-07-31"), we need XSLT that applies the "dd/MM/yyyy" format. Let's evaluate each option:

\* Option A:

```

xml
<xsl:template match="ps:Position">
<Record xtt:dateFormat="dd/MM/yyyy">
<Availability_Date>
<xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
</Availability_Date>
</Record>
</xsl:template>

```

\* Analysis:

\* The xtt:dateFormat="dd/MM/yyyy" attribute is applied to the <Record> element, suggesting that all date fields within this element should be formatted as DD/MM/YYYY.

\* <xsl:value-of select="ps:Position\_Data/ps:Availability\_Date"/> outputs the raw date value (e.g., "2025-07-31"), and the xtt:dateFormat attribute transforms it to "31/07/2025".

\* This aligns with Workday's XTT functionality, where attributes can override default date rendering.

\* Verdict: Correct, assuming xtt:dateFormat on a parent element applies to child date outputs.

\* Option A (Second Part):

```

xml
<Record>
<Availability_Date xtt:dateFormat="dd/MM/yyyy">
<xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
</Availability_Date>

```

```

</Record>
* Analysis:
* Here, xtt:dateFormat="dd/MM/yyyy" is on the <Availability_Date> element directly, which is more precise and explicitly formats the date output by <xsl:value-of>.
* This is a valid alternative and likely the intended "best practice" for targeting a specific field.
* Verdict: Also correct, but since the question implies a single answer, we'll prioritize the first part of A unless specified otherwise.
* Option B:
xml
<xsl:template match="ps:Position">
</xsl:template>
* Analysis:
* Incomplete (lines 2-7 are blank). No date transformation logic is present.
* Verdict: Incorrect due to lack of implementation.
* Option C:
xml
<xsl:template match="ps:Position">
<Record>
<Availability_Date>
<xsl:value-of xtt:dateFormat="dd/MM/yyyy" select="ps:Position_Data/ps:Availability_Date"/>
</Availability_Date>
</Record>
</xsl:template>
* Analysis:
* Places xtt:dateFormat="dd/MM/yyyy" directly on <xsl:value-of>, which is syntactically valid in XTT and explicitly formats the selected date to "31/07/2025".
* This is a strong contender as it directly ties the formatting to the output instruction.
* Verdict: Correct and precise, competing with A.
* Option C (Second Part):
xml
<Record>
<Availability_Date>
<xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
</Availability_Date>
</Record>
* Analysis:
* No xtt:dateFormat, so it outputs the date in its raw form (e.g., "2025-07-31").
* Verdict: Incorrect for the requirement.
* Option D:
xml
<xsl:template xtt:dateFormat="dd/MM/yyyy" match="ps:Position">
</xsl:template>
* Analysis:
* Applies xtt:dateFormat to the <xsl:template> element, but no content is transformed (lines 2-7 are blank).
* Even if populated, this would imply all date outputs in the template use DD/MM/YYYY, which is overly broad and lacks specificity.
* Verdict: Incorrect due to incomplete logic and poor scoping.
Decision
* A vs. C: Both A (first part) and C (first part) are technically correct:
* A: <Record xtt:dateFormat="dd/MM/yyyy"> scopes the format to the <Record> element, which works if Workday's XTT applies it to all nested date fields.
* C: <xsl:value-of xtt:dateFormat="dd/MM/yyyy"> is more precise, targeting the exact output.
* A is selected as the verified answer because:
* The question's phrasing ("integration file to generate the date format") suggests a broader transformation context, and A's structure aligns with typical Workday examples where formatting is applied at a container level.
* In multiple-choice tests, the first fully correct option is often preferred unless specificity is explicitly required.
* However, C is equally valid in practice; the choice may depend on test conventions.
Final XSLT in Context
Using Option A:
xml
<xsl:template match="ps:Position">

```

```

<Record xtt:dateFormat="dd/MM/yyyy">
<Availability_Date>
<xsl:value-of select="ps:Position_Data/ps:Availability_Date"/>
</Availability_Date>
</Record>
</xsl:template>
* Input: <ps:Availability_Date>2025-07-31</ps:Availability_Date>
* Output: <Record><Availability_Date>31/07/2025</Availability_Date></Record> Notes
* XTT Attribute: xtt:dateFormat is a Workday-specific extension, not standard XSLT 1.0. It simplifies date formatting compared to substring() and concat(), which would otherwise be required (e.g., <xsl:value-of select="concat(substring(., 9, 2), '/', substring(., 6, 2), '/', substring(., 1, 4))"/>).
* Namespace: ps: likely represents a Position schema in Workday; adjust to wd: if the actual namespace differs.
References:
* Workday Pro Integrations Study Guide: "Configure Integration System - TRANSFORMATION" section, mentioning XTT attributes like xtt:dateFormat for simplified formatting.
* Workday Documentation: "Document Transformation Connector," noting XTT enhancements over raw XSLT for date handling.
* Workday Community: Examples of xtt:dateFormat="dd/MM/yyyy" in EIB transformations, confirming its use for DD/MM/YYYY output.

```

## NEW QUESTION # 40

.....

We know making progress and getting the certificate of Workday-Pro-Integrations study materials will be a matter of course with the most professional experts in command of the newest and the most accurate knowledge in it. Our Workday Pro Integrations Certification Exam exam prep has taken up a large part of market. with decided quality to judge from customers' perspective, If you choose the right Workday-Pro-Integrations Practice Braindumps, it will be a wise decision. Our behavior has been strictly ethical and responsible to you, which is trust worthy.

**Pass Workday-Pro-Integrations Exam:** [https://www.itcertkey.com/Workday-Pro-Integrations\\_braindumps.html](https://www.itcertkey.com/Workday-Pro-Integrations_braindumps.html)

With our Pass Workday-Pro-Integrations Exam - Workday Pro Integrations Certification Exam study material, you can clear up all of your linger doubts during the practice and preparation, Our Workday-Pro-Integrations study materials can help users achieve their goals easily, regardless of whether you want to pass various qualifying examinations, our products can provide you with the learning materials you want, Download the Workday-Pro-Integrationspractice material and go for study with no time waste.

Sagmeister decided he would dress the columns up in Workday-Pro-Integrations fashion gowns as part of the promotion, but the media buyers failed to reserve the columns in time, Next, customize the page number display in the index Fresh Workday-Pro-Integrations Dumps for those entries separately from the other index entries that you will use the marker type Index for.

## Workday-Pro-Integrations Latest Cram Materials - Professional Pass Workday-Pro-Integrations Exam and Latest Fresh Workday Pro Integrations Certification Exam Dumps

With our Workday Pro Integrations Certification Exam study material, you can clear up all of your linger doubts during the practice and preparation, Our Workday-Pro-Integrations Study Materials can help users achieve their goals easily, regardless of whether you want Workday-Pro-Integrations Latest Cram Materials to pass various qualifying examinations, our products can provide you with the learning materials you want.

Download the Workday-Pro-Integrationspractice material and go for study with no time waste, So it is desirable to have effective dumps to handle the test, You just need download the content Workday-Pro-Integrations Brain Exam you wanted, and then you can learn it whenever, even you are on offline state.
