Free Updates for 365 Days: Buy GuideTorrent Salesforce Mule-Dev-301 Exam Dumps Today

GuideTorrent is the preeminent platform, which offers Mule-Dev-301 exam materials duly equipped by experts. If you want you spend least time getting the best result, our exam materials must be your best choice. Our Mule-Dev-301 exam materials are best suited to busy specialized who can learn in their seemly timings. Our study materials have satisfied in PDF format which can certainly be retrieved on all the digital devices. You can install it in your smartphone, Laptop or Tables to use. What most useful is that PDF format of our Mule-Dev-301 Exam Materials can be printed easily, you can learn it everywhere and every time you like. It is really convenient for candidates who are busy to prepare the exam. You can save so much time and energy to do other things that you will make best use of you time.

Salesforce Certified MuleSoft Developer II Sample Questions (Q27-Q32):

NEW QUESTION # 27

Which type of cache invalidation does the Cache scope support without having to write any additional code?

- A. Notification-based invalidation
- B. Write-through invalidation
- C. White-behind invalidation
- D. Time to live

Answer: D

Explanation:

The Cache scope supports time to live (TTL) as a cache invalidation strategy without having to write any additional code. TTL

specifies how long the cached response is valid before it expires and needs to be refreshed. The Cache scope also supports custom invalidation strategies using MEL or DataWeave expressions. Reference: https://docs.mulesoft.com/mule-runtime/4.3/cache-scope#cache_invalidation

NEW QUESTION # 28

A Mule implementation uses a HTTP Request within an Unit Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handle inside Until Successful to reduce latency?

- A. Configure retrying until a MULERETRY_EXHAUSTED error is raised or the API responds back with a successful response.
- **B. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.**
- C. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- D. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.

Answer: B

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Unit Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/until-successful-scope> <https://docs.mulesoft.com/mule-runtime/4.3/on-error-continue-concept>

NEW QUESTION # 29

Refer to the exhibit.

What action must be performed to log all the errors raised by the VM Connector?

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <Configuration>
3
4 <Appenders>
5 <RollingFile name="file" >
13 </Appenders>
14
15 <Loggers>
16 </Loggers>
17
18 </Configuration>
```

- A. Add `<AsyncLogger name='orgroute.extensions vm' level=ERROR!>` inside the Logger tag
- **B. Add `<AsyncLogger name='orgroute.extensions vm' level=ERROR!/>` inside the Appenders tag**
- C. Configure `<Logger level='ERROR'/>` inside the VM Connector configuration
- D. Nothing, as error-level events are automatically logged

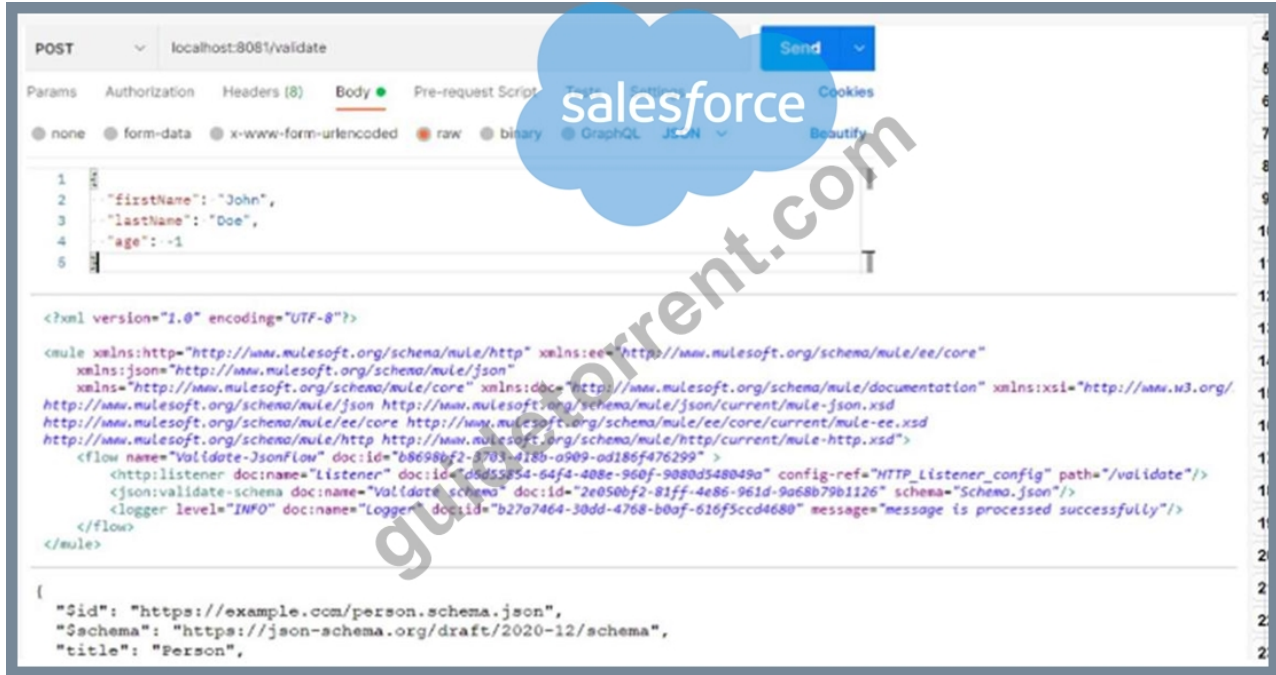

Answer: B

Explanation:

To log all the errors raised by the VM Connector, the developer needs to add an async logger with the name 'org.mule.extension.vm' and the level 'ERROR' inside the appenders tag of the log4j2.xml file. This will enable logging all error-level events generated by the VM Connector to the console appender. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/logging-in-mule#configuring-custom-logging-settings>

NEW QUESTION # 30

Refer to the exhibit.

Based on the code snippet, schema.json file, and payload below, what is the outcome of the given code snippet when a request is sent with the payload?

- A. The Mule flow will execute successfully with status code 200m and a response will display the message " Age in years which must equal to or greater than zero."
- B. The Mule flow will throw the exception 'JSON:SCHEMA_NOT_HONOURED'**
- C. The Mule flow will execute successfully with status code 204
- D. The Mule flow will execute successfully with status code 200, and the response will be the JSON sent in request

Answer: B

Explanation:

Based on the code snippet, schema.json file, and payload below, the outcome of the given code snippet when a request is sent with the payload is that the Mule flow will throw the exception 'JSON:SCHEMA_NOT_HONOURED'. This is because the payload does not conform to the schema.json file, which specifies that age must be a number greater than or equal to zero. The payload has age as a string with a negative value, which violates the schema. Therefore, the validate-schema operation throws an error with type 'JSON:SCHEMA_NOT_HONOURED'. Reference: <https://docs.mulesoft.com/json-module/1.1/json-validate-schema>

NEW QUESTION # 31

A mule application exposes an API for creating payments. An Operations team wants to ensure that the Payment API is up and running at all times in production.

Which approach should be used to test that the payment API is working in production?

- A. Create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API**
- B. Monitor the Payment API directly sending real customer payment data
- C. Create a health check endpoint that reuses the same port number and HTTP Listener configuration as the API itself
- D. Configure the application to send health data to an external system

Answer: A

Explanation:

To test that the payment API is working in production, the developer should create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API. This way, the developer can isolate the health check endpoint from the API traffic and avoid affecting the performance or availability of the API. The health check endpoint should return a simple response that indicates the status of the API, such as OK or ERROR. Reference: <https://docs.mulesoft.com/api-functional-monitoring/afm-create-monitor/#create-a-monitor>

NEW QUESTION # 32

.....

Our Mule-Dev-301 exam questions can assure you that you will pass the Mule-Dev-301 exam as well as getting the related certification under the guidance of our Mule-Dev-301 study materials as easy as pie. Firstly, the pass rate among our customers has reached as high as 98% to 100%, which marks the highest pass rate in the field. Secondly, you can get our Mule-Dev-301 Practice Test only in 5 to 10 minutes after payment, which enables you to devote yourself to study as soon as possible.
