Snowflake SnowPro Advanced Architect Certification Sample Questions (Q227-Q232):

NEW QUESTION # 227

An Architect runs the following SQL query:

How can this query be interpreted?

- A. FILEROWS is a file. FILE_ROW_NUMBER is the file format location.
- B. FILERONS is the file format location. FILE_ROW_NUMBER is a stage.
- **C. FILEROWS is a stage. FILE_ROW_NUMBER is line number in file.**
- D. FILEROWS is the table. FILE_ROW_NUMBER is the line number in the table.

Answer: C

Explanation:

* A stage is a named location in Snowflake that can store files for data loading and unloading. A stage can be internal or external, depending on where the files are stored.

* The query in the question uses the LIST function to list the files in a stage named FILEROWS. The function returns a table with various columns, including FILE_ROW_NUMBER, which is the line number of the file in the stage.

* Therefore, the query can be interpreted as listing the files in a stage named FILEROWS and showing the line number of each file in the stage.

NEW QUESTION # 228

A user is executing the following command sequentially within a timeframe of 10 minutes from start to finish:

What would be the output of this query?

- **A. Table T_SALES_CLONE successfully created.**
- B. The offset -> is not a valid clause in the clone operation.
- C. Syntax error line 1 at position 58 unexpected 'at'.
- D. Time Travel data is not available for table T_SALES.

Answer: A

Explanation:

The query is executing a clone operation on an existing table t_sales with an offset to account for the retention time. The syntax used is correct for cloning a table in Snowflake, and the use of the at(offset => -60*30) clause is valid. This specifies that the clone should be based on the state of the table 30 minutes prior (60 seconds * 30). Assuming the table t_sales exists and has been modified within the last 30 minutes, and considering the data_retention_time_in_days is set to 1 day (which enables time travel queries for the past 24 hours), the table t_sales_clone would be successfully created based on the state of t_sales 30 minutes before the clone command was issued.

NEW QUESTION # 229

A user has activated primary and secondary roles for a session.

What operation is the user prohibited from using as part of SQL actions in Snowflake using the secondary role?

- A. Delete
- B. Insert
- **C. Create**
- D. Truncate

Answer: C

Explanation:

In Snowflake, when a user activates a secondary role during a session, certain privileges associated with DDL (Data Definition Language) operations are restricted. The CREATE statement, which falls under DDL operations, cannot be executed using a secondary role. This limitation is designed to enforce role-based access control and ensure that schema modifications are managed carefully, typically reserved for primary roles that have explicit permissions to modify database structures. References: Snowflake's security and access control documentation specifying the limitations and capabilities of primary versus secondary roles in session management.

NEW QUESTION # 230

A Snowflake Architect is designing an application and tenancy strategy for an organization where strong legal isolation rules as well as multi-tenancy are requirements.

Which approach will meet these requirements if Role-Based Access Policies (RBAC) is a viable option for isolating tenants?

- A. Create accounts for each tenant in the Snowflake organization.
- B. Create an object for each tenant strategy if row level security is viable for isolating tenants.
- **C. Create an object for each tenant strategy if row level security is not viable for isolating tenants.**
- D. Create a multi-tenant table strategy if row level security is not viable for isolating tenants.

Answer: C

Explanation:

This approach meets the requirements of strong legal isolation and multi-tenancy. By creating separate accounts for each tenant, the application can ensure that each tenant has its own dedicated storage, compute, and metadata resources, as well as its own encryption keys and security policies. This provides the highest level of isolation and data protection among the tenancy models. Furthermore, by creating the accounts within the same Snowflake organization, the application can leverage the features of Snowflake Organizations, such as centralized billing, account management, and cross-account data sharing.
