## New 102-500 Exam Price & 102-500 Test Collection Pdf

When we are in some kind of learning web site, often feel dazzling, because web page design is not reasonable, put too much information all rush, it will appear desultorily. Believe it or not, we face the more intense society, and we should prompt our competitiveness and get a 102-500 certification to make our dreams come true. Although it is not an easy thing to achieve it, once you choose our 102-500 prepare torrent, we will send the new updates for one year long, which is new enough to deal with the exam for you and guide you through difficulties in your exam preparation.

## Lpi LPIC-1 Exam 102, Part 2 of 2, version 5.0 Sample Questions (Q72-Q77):

### NEW QUESTION # 72

What is the purpose of the iconv command?

- A. It verifies that the root directory tree complies to all conventions from the Filesystem Hierarchy Standard (FHS).
- **B. It converts files from one character encoding to another.**
- C. It changes the mode of an inode in the ext4 file system.
- D. It displays additional meta information from icon files ending in .ico.
- E. It converts bitmap images from one format to another such as PNG to JPEG.

**Answer: B**

Explanation:

The iconv command is used to convert the encoding of a file from one character set to another. A character set is a collection of characters that are assigned numerical values called code points. Different character sets may use different numbers of bytes to represent each character, and may have different mappings of code points to characters. For example, ASCII is a single-byte character set that encodes 128 characters, while UTF-8 is a variable-length character set that can encode over a million characters. The iconv command can convert between many different character sets, such as ASCII, UTF-8, ISO-8859-1, etc. The basic syntax for using the command is as follows:

iconv [options] -f from-encoding -t to-encoding input-file > output-file The -f option specifies the encoding of the input file, and the -t option specifies the encoding of the output file.

The input file is read from standard input, and the output file is written to standard output, unless specified otherwise. The iconv command can also list all the supported character sets with the -l option<sup>1234</sup>. References:

### NEW QUESTION # 73

Which of the following is a legacy program provided by CUPS for sending files to the printer queues on the command line?

- A. lpd
- B. lpq
- **C. lpr**
- D. lpp

**Answer: C**

Explanation:

The lpr command is a legacy program provided by CUPS for sending files to the printer queues on the command line. It is one of the Berkeley (lpr) printing commands that CUPS supports for compatibility with other Unix-like systems. The lpr command accepts one or more filenames as arguments and sends them to the default or specified printer. It also supports several options to control the printing process, such as the number of copies, the page size, the orientation, and the priority. The lpr command is equivalent to the lp command, which is one of the System V (lp) printing commands that CUPS also supports. However, the lp command has more options and features than the lpr command, and is recommended for use with CUPS. References:

### NEW QUESTION # 74

Which of the following files is not read directly by a Bash login shell?

- **A. ~/.bashrc**
- B. ~/.profile
- C. ~/.bash\_profile
- D. ~/.bash\_login
- E. /etc/profile

**Answer: A**

### NEW QUESTION # 75

Given the following routing table:

How would an outgoing packet to the destination 192.168.2.150 be handled?

- A. It would be passed to the default router 192.168.178.1 on wlan0.
- B. It would be directly transmitted on the device wlan0.
- C. It would be passed to the default router 255.255.255.0 on eth0.
- D. It would be directly transmitted on the device eth0.
- E. It would be passed to the router 192.168.1.1 on eth0.

**Answer: E**

Explanation:

The routing table shows how the kernel will route packets to different destinations based on the destination IP address, the gateway, the netmask, the flags, the metric, and the interface. The kernel will try to find the most specific route that matches the destination IP address, which means the route with the longest netmask. If there are multiple routes with the same netmask, the kernel will use the route with the lowest metric. If there is no matching route, the kernel will use the default route, which is the route with the destination 0.0.0.0.

In this case, the destination IP address is 192.168.2.150, which belongs to the network 192.168.2.0/24. The routing table has a specific route for this network, which is the second entry. The gateway for this route is 0.0.0.0, which means that the packet will be directly transmitted on the interface eth0, without passing through any router. The netmask for this route is 255.255.255.0, which means that the network has 256 possible hosts. The flags for this route are U, which means that the route is up, and G, which means that the route is to a gateway. The metric for this route is 0, which means that it has the highest priority. Therefore, the kernel will use this route to handle the outgoing packet to the destination 192.168.2.150.
