Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q157-Q162):

NEW QUESTION # 157

A company has a service that reads and writes large amounts of data from an Amazon S3 bucket in the same AWS Region. The service is deployed on Amazon EC2 instances within the private subnet of a VPC. The service communicates with Amazon S3 over a NAT gateway in the public subnet. However, the company wants a solution that will reduce the data output costs.

Which solution will meet these requirements MOST cost-effectively?

- A. Provision a dedicated EC2 NAT instance in the private subnet. Configure the route table for the public subnet to use the elastic network interface of this instance as the destination for all S3 traffic.
- **B. Provision a VPC gateway endpoint. Configure the route table for the private subnet to use the gateway endpoint as the route for all S3 traffic.**
- C. Provision a second NAT gateway. Configure the route table for the private subnet to use this NAT gateway as the destination for all S3 traffic.
- D. Provision a dedicated EC2 NAT instance in the public subnet. Configure the route table for the private subnet to use the elastic network interface of this instance as the destination for all S3 traffic.

Answer: B

Explanation:

it allows the company to reduce the data output costs for accessing Amazon S3 from Amazon EC2 instances in a VPC. By provisioning a VPC gateway endpoint, the company can enable private connectivity between the VPC and S3. By configuring the route table for the private subnet to use the gateway endpoint as the route for all S3 traffic, the company can avoid using a NAT gateway, which charges for data processing and data transfer. Which action will MOST securely grant the EC2 instance access to the S3 bucket?

- A. Attach a resource-based policy to the S3 bucket
- B. Store AWS credentials directly on the EC2 instance for applications on the instance to use for API calls
- **C. Associate an IAM role with least privilege permissions to the EC2 instance profile**
- D. Create an IAM user for the application with specific permissions to the S3 bucket

Answer: C

NEW QUESTION # 159

A favored client needs you to quickly deploy a database that is a relational database service with minimal administration as he wants to spend the least amount of time administering it. Which database would be the best option?

- A. Amazon SimpleDB
- **B. Amazon RDS**
- C. Your choice of relational AMIs on Amazon EC2 and EBS.
- D. Amazon Redshift

Answer: B

Explanation:

Amazon Relational Database Service (Amazon RDS) is a web service that makes it easy to set up, operate, and scale a relational

database in the cloud. It provides cost-efficient and resizable capacity while managing time-consuming database administration tasks, freeing you up to focus on your applications and business.

Amazon RDS gives you access to the capabilities of a familiar MySQL, Oracle, SQL Server, or PostgreSQL database engine. This means that the code, applications, and tools you already use today with your existing databases can be used with Amazon RDS. Amazon RDS automatically patches the database software and backs up your database, storing the backups for a user-defined retention period and enabling point-in-time recovery.

- **C. Configure Amazon FSx for Windows File Server. Mount the Amazon FSx volume to each Windows instance.**
- D. Configure a volume using Amazon EFS. Mount the EFS volume to each Windows instance.

Answer: C

The company experienced some data corruption issues in the past and wants to move the application to AWS.

The company needs to implement a solution to optimize the stability of the application. The solution also must give the company the ability to restore a customer's database to a specific point in time. The company will migrate customer data by using AWS Database Migration Service (AWS DMS).

Which architecture should a solutions architect recommend to meet these requirements?

- A. Set up an Amazon RDS database for each customer. Deploy the application by using an Amazon EC2 launch template. Use user data to configure the customer-specific data.
- **B. Set up an Amazon RDS database and an Amazon EC2 instance for each customer. Download the installation script. Run the script to install and configure the application.**
- C. Set up a shared Amazon Aurora database. Configure an Amazon EC2 launch template for each customer.
- D. Set up a shared Amazon Aurora database. Create an Amazon EC2 Amazon Machine Image (AMI) for each customer. Use the AMI to launch the application.
