WGU Data Management – Foundations Exam Sample Questions (Q60-Q65):

NEW QUESTION # 60

What is the first step of the analysis phase for designing a database?

- A. Implement attributes
- **B. Identify entities**
- C. Determine cardinality
- D. Draw an entity-relationship (ER) diagram

Answer: B

Explanation:

The first step in database analysis is identifying entities, which are the real-world objects that need to be represented in the database.

Example Usage:

* In a school system, the main entities could be:

Students, Courses, Instructors

Why Other Options Are Incorrect:

* Option A (Determine cardinality) (Incorrect): Determining relationships comes after identifying entities.

* Option C (Draw an ER diagram) (Incorrect): ER diagrams visualize entities but are not the first step.

* Option D (Implement attributes) (Incorrect): Attributes are defined after entities are identified.

Thus, the correct answer is Identify entities, as entities form the foundation of the database model.

NEW QUESTION # 61

Which phase of entity-relationship modeling refers to the maxima and minima of relationships and attributes?

- A. Physical design
- **B. Cardinality**
- C. Partition
- D. Attribute minimum

Answer: B

Explanation:

Cardinality defines the minimum and maximum number of occurrences of one entity in relation to another.

Example Usage in an ER Model:

* One-to-Many (1:M): A customer can place multiple orders, but each order belongs to only one customer.

Customers (1) --- (M) Orders

* Cardinality notation:

(1,1) # One-to-One

(0,M) # Zero-to-Many

(1,M) # One-to-Many

Why Other Options Are Incorrect:

* Option B (Physical design) (Incorrect): Focuses on storage and indexing, not relationships.

* Option C (Attribute minimum) (Incorrect): No such formal term in database modeling.

* Option D (Partition) (Incorrect): Refers to dividing tables, not relationship constraints.

Thus, the correct answer is Cardinality, as it defines min/max constraints on relationships.

NEW QUESTION # 62

Which keyword or clause indicates the desired sequence when displaying a set of records returned from a SELECT statement?

- A. BETWEEN
- B. LIKE
- C. DISTINCT
- **D. ORDER BY**

Answer: D

Explanation:

The ORDER BY clause in SQL is used to sort query results in ascending (ASC) or descending (DESC) order.

Example Usage:

sql

SELECT Name, Salary FROM Employees ORDER BY Salary DESC;

* This retrieves all employees, sorted by salary in descending order.

Why Other Options Are Incorrect:

* Option A (BETWEEN) (Incorrect): Used for filtering ranges but does not order results.

* Option B (DISTINCT) (Incorrect): Removes duplicate rows but does not control order.

* Option D (LIKE) (Incorrect): Used for pattern matching, not sorting.

Thus, ORDER BY is the correct choice for defining the sequence of query results.

NEW QUESTION # 63

Which operation finds an entry containing a search value by repeatedly splitting the index in two?

- **A. Binary search**
- B. Index scan
- C. Fan-out
- D. Table scan

Answer: A

Explanation:

Binary search is an algorithm that finds a search value by repeatedly dividing the search space into two halves. It is commonly used in indexed searches.

Example Usage in Databases:

* B-Trees and B+ Trees (used in database indexing) apply binary search to navigate the index efficiently.

* If searching for ID = 50 in an sorted list of IDs, binary search:

* Splits the list into two halves.

* Checks the middle value.

* Eliminates half of the dataset.

* Repeats until the value is found.

Why Other Options Are Incorrect:

- * Option A (Table scan) (Incorrect): Reads every row, much slower than binary search.
 - * Option C (Index scan) (Incorrect): Uses indexes but does not necessarily apply binary search.
 - * Option D (Fan-out) (Incorrect): Describes branching in B-Trees, not searching.
- Thus, the correct answer is Binary search, as it repeatedly splits the index in two.

NEW QUESTION # 64

Which entity in a table is a measurable object in the real world?

- A. Conceptual entity
- B. Virtual entity
- C. Logical entity
- **D. Tangible entity**

Answer: D

Explanation:

A tangible entity is a real-world object that can be measured and stored in a database.

Example Usage:

* In an inventory system, tangible entities include:

Products, Orders, Customers

Why Other Options Are Incorrect:

* Option A (Logical entity) (Incorrect): Exists logically but may not have a physical presence (e.g., views, categories).

* Option C (Virtual entity) (Incorrect): Exists only in queries or reports, not stored as real data.

* Option D (Conceptual entity) (Incorrect): Abstract idea used in design modeling, not a stored entity.

Thus, the correct answer is Tangible entity, as it represents measurable, real-world objects.
