Our CTAL-TM-001 exam materials can help you stand out in the fierce competition. After using our CTAL-TM-001 study questions, you have a greater chance of passing the CTAL-TM-001 certification, which will greatly increase your soft power and better show your strength. Our CTAL-TM-001 training guide can bring you something. After you have used our CTAL-TM-001 learning braindump, you will certainly have your own experience. Now let's take a look at why a worthy product of your choice is our CTAL-TM-001 actual exam.

ISTQB Certified Tester Advanced Level - Test Manager Sample Questions (Q83-Q88):

NEW QUESTION # 83

Which of the following is a factor that is likely to increase the test estimate?

- A. Assigned personnel who are experienced on working with similar projects in similar environments
- **B. Use of a new technology**
- C. A requirement for high level test documentation
- D. Static test data

Answer: B

Explanation:

A test estimate is an approximation of the amount of effort, time, and resources required to perform testing activities for a software project¹. A test estimate can be influenced by various factors, such as the size, complexity, and quality of the software, the scope, objectives, and approach of the testing, the skills, experience, and availability of the test team, the tools, methods, and standards used for testing, and the constraints, risks, and assumptions related to the project². One of the factors that is likely to increase the test estimate is the use of a new technology. A new technology is a technology that is unfamiliar or unproven to the test team or the organization, such as a new programming language, framework, platform, or tool³. The use of a new technology can increase the test estimate because it may require more time and effort to learn, understand, and apply the technology, as well as to deal with potential issues, challenges, or limitations that may arise from the technology. Therefore, option A is the correct answer. Option B is incorrect because a requirement for high level test documentation is not a factor that is likely to increase the test estimate, but rather a factor that is likely to increase the test documentation effort. Test documentation is the set of documents that describe the test basis, test objectives, test design, test procedures, test results, and test evaluation of a software project. A requirement for high level test documentation means that the test documents need to be detailed, comprehensive, and consistent, which may require more time and effort to produce, review, and maintain. However, this does not necessarily affect the test estimate, as the test documentation effort can be considered as a separate or parallel activity to the test execution effort. Option C is incorrect because assigned personnel who are experienced on working with similar projects in similar environments is not a factor that is likely to increase the test estimate, but rather a factor that is likely to decrease the test estimate. Experienced personnel are personnel who have the relevant knowledge, skills, and abilities to perform the testing activities for a software project. Assigned personnel who are experienced on working with similar projects in similar environments can decrease the test estimate because they may require less time and effort to understand, design, implement, and execute the tests, as well as to deal with potential issues, challenges, or limitations that may arise from the

project. Option D is incorrect because static test data is not a factor that is likely to increase the test estimate, but rather a factor that is likely to decrease the test estimate. Test data is the data that is used as input or output for the tests. Static test data is test data that is fixed and predefined, and does not change during the test execution. Static test data can decrease the test estimate because it may require less time and effort to create, manage, and maintain, as well as to ensure the validity, reliability, and traceability of the test data. NEW QUESTION # 85

Which one of the following will allow phase containment to be assessed within a testing project? SELECT ONE OPTION

- A. Using the phases of defect introduction, detection and removal data on a phase by phase basis.
- **B. Using the phases of defect introduction and detection data for all phases of the project.**
- C. Using defect introduction and removal data for the project as a whole.
- D. Using defect removal data for the testing phases of the project.

Answer: B

NEW QUESTION # 86

Which of the following can demotivate a tester? [1]

- A. Working extra hours, resulting in a successful product deployment
- B. When metrics indicate weaknesses in their testing
- **C. When testing is cut short, resulting in a high number of production defects**
- D. Receiving direct and honest feedback on areas to improve

Answer: C

Explanation:

This can demotivate a tester because it implies that the tester's work is not valued or respected by the management or the stakeholders. It also suggests that the tester's efforts and skills are wasted or ineffective, as the product quality is compromised and the customer satisfaction is reduced. Testing is cut short when there is insufficient time, budget, or resources allocated for testing, or when there is pressure to release the product without adequate testing. This can lead to frustration, dissatisfaction, and loss of confidence among the testers. Top 6 things that demotivate a developer

NEW QUESTION # 87

You are writing a system test level plan and are defining the test activities that must take place during test implementation. There is an

established project risk register in place, with product risks addressing all new features to be developed. Three time-boxed cycles of system test execution are planned, and all the new features will be delivered in the first cycle.

The project test strategy states that the stakeholders require an overall view of the product quality for these features. This should be achieved by planning to test each product risk, to some degree, during the first cycle of test execution.

Which risk-based mitigation approach should be adopted during test implementation, to BEST meet the stakeholders' requirement?

- A. Breadth-first test scheduling
- B. FMEA
- C. Depth-first test scheduling
- D. Cost of exposure analysis

Answer: A

Explanation:

Breadth-first test scheduling ensures that all identified risks are at least partially covered early in the test execution. This meets the stakeholder requirement of having an "overall view of product quality" in the first cycle. This strategy contrasts with depth-first, which goes deep on a few risks but ignores others at first, potentially missing critical early signals. Breadth-first aligns with the risk-based testing approach, where test prioritization aims at giving broad early insight into product risk mitigation.

NEW QUESTION # 88

.....

Being anxious for the CTAL-TM-001 exam ahead of you? Have a look of our CTAL-TM-001 training engine please. Presiding over the line of our practice materials over ten years, our experts are proficient as elites who made our CTAL-TM-001 learning questions, and it is their job to officiate the routines of offering help for you. All points are predominantly related with the exam ahead of you. You will find the exam is a piece of cake with the help of our CTAL-TM-001 Study Materials.
