So sales and customer satisfaction improved dramatically. So we make great contribution both to line and customers greatly.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q239-Q244):

NEW QUESTION # 239

An administrator created a connected app for a custom web application in Salesforce which needs to be visible as a tile in App Launcher. The tile for the custom web application is missing in the app launcher for all users in Salesforce. The administrator requested assistance from an identity architect to resolve the issue.

Which two reasons are the source of the issue?

Choose 2 answers

- A. Session Policy is set as 'High Assurance Session required' for this connected app.
- B. OAuth scope does not include "openid".

- C. The connected app is not set in the App menu as 'Visible in App Launcher'.
- D. StartURL for the connected app is not set in Connected App settings.

Answer: C,D

Explanation:

Explanation

The StartURL for the connected app is required to specify the landing page for the app. The connected app must also be set as visible in the App Launcher to appear as a tile for users. References: Connected App Basics, Manage Connected Apps

NEW QUESTION # 240

A global company's Salesforce Identity Architect is reviewing its Salesforce production org login history and is seeing some intermittent Security Assertion Markup Language (SAML SSO) 'Replay Detected and Assertion Invalid' login errors.

Which two issues would cause these errors?

Choose 2 answers

- A. The assertion sent to Salesforce contains an assertion ID previously used.
- B. The current time setting of the company's identity provider (IdP) and Salesforce platform is out of sync by more than eight minutes.
- C. The certificate loaded into SSO configuration does not match the certificate used by the IdP.
- D. The subject element is missing from the assertion sent to Salesforce.

Answer: A,B

Explanation:

A SAML SSO 'Replay Detected and Assertion Invalid' error occurs when Salesforce detects that the same assertion has been used more than once within the validity period. This can happen if the assertion ID is reused by the IdP or if the assertion is resent by the user. Another possible cause is that the time settings of the IdP and Salesforce are not synchronized, which can result in an assertion being valid for a shorter or longer period than expected. References: SAML Single Sign-On Settings, Troubleshoot SAML Single Sign-On

NEW QUESTION # 241

An insurance company has a connected app in its Salesforce environment that is used to integrate with a Google Workspace (formerly known as G Suite).

An identity and access management (IAM) architect has been asked to implement automation to enable users, freeze/suspend users, disable users, and reactivate existing users in Google Workspace upon similar actions in Salesforce.

Which solution is recommended to meet this requirement?

- A. Build an Apex trigger on the userlogin object to make asynchronous callouts to Google APIs.
- B. Update the Security Assertion Markup Language Just-in-Time (SAML JIT) handler in Salesforce for user provisioning and de-provisioning.
- C. Configure user Provisioning for Connected Apps.
- D. Build a custom REST endpoint in Salesforce that Google Workspace can poll against.

Answer: C

NEW QUESTION # 242

Universal Containers (UC) has a desktop application to collect leads for marketing campaigns. UC wants to extend this application to integrate with Salesforce to create leads. Integration between the desktop application and Salesforce should be seamless. What Authorization flow should the Architect recommend?

- A. User Agent Flow
- B. Web Server Authentication Flow
- C. Username and Password Flow
- D. JWT Bearer Token Flow

Answer: A

NEW QUESTION # 243

Universal Containers (UC) wants to use Salesforce for sales orders and a legacy of system for order fulfillment. The legacy system must update the status of orders in 65* Salesforce in real time as they are fulfilled. UC decides to use OAuth for connecting the legacy system to Salesforce. What OAuth flow should be considered that doesn't require storing credentials, client secret or refresh tokens?

- A. JWT Bearer Token flow
- B. Web Server flow
- C. Username-Password flow
- D. User Agent flow

Answer: A

Explanation:

Explanation

The JWT Bearer Token flow is an OAuth flow in which an external app (also called client or consumer app) sends a signed JSON string to Salesforce called JWT to obtain an access token. The access token can then be used by the external app to read & write data in Salesforce¹. This flow does not require storing credentials, client secret or refresh tokens, as the JWT is self-contained and includes information about the app and the user². The other flows require either user interaction (Web Server flow and User Agent flow) or storing credentials (Username-Password flow)³.
