問題 #61
Which hardware platform is Cisco Unified Communications Manager typically deployed on?

- A. Cisco ISR routers
- B. Cisco Catalyst switches
- C. Cisco ASR routers
- D. Cisco UCS C-Series servers

答案：D

解題說明：
Cisco Unified Communications Manager (CUCM) is typically deployed on Cisco UCS C-Series servers. These rack-mount servers provide the necessary computing resources to support CUCM's call control and session management functions in enterprise environments. The UCS C-Series servers offer scalability, reliability, and integration capabilities essential for unified communications deployments.
Options A (Cisco ASR routers), B (Cisco Catalyst switches), and C (Cisco ISR routers) are networking devices designed for routing and switching functions and are not intended as platforms for deploying CUCM.

問題 #62

What is the primary purpose of changing the configuration register when performing password recovery?

- A. To ignore the startup configuration
- B. To erase the entire configuration
- C. To unlock all user accounts
- D. To enable advanced debugging features

答案：A

解題說明：
During password recovery on Cisco devices, the configuration register is modified to instruct the device to bypass the startup configuration stored in NVRAM. This allows administrators to access the device without being prompted for existing passwords. The standard procedure involves changing the configuration register value to 0x2142, which tells the device to ignore the startup configuration during the next boot. Once access is gained, the administrator can reset passwords and then restore the original configuration by resetting the configuration register to its default value, typically 0x2102.

問題 #63
Which mode must the console terminal of the device be in before a prewritten configuration is pasted to transfer the configuration from an old device to a new one?

- A. Privileged EXEC mode
- B. Interface configuration mode
- C. User EXEC mode
- D. Global configuration mode

答案：D

解題說明：
To apply a prewritten configuration to a new Cisco device, the console terminal must be in Global Configuration Mode. This mode allows administrators to enter configuration commands that affect the device's overall operation. To access Global Configuration Mode, one must first enter Privileged EXEC Mode by typing enable, and then enter configure terminal. Once in Global Configuration Mode, the prewritten configuration can be pasted, and the device will accept the commands accordingly.

問題 #64
Which deployment scenarios are Cisco 8000 Series routers primarily designed for?

- A. campus LAN access and distribution layers
- B. remote branch offices and retail locations
- C. service provider and web-scale networks
- D. small business and home office networks

答案：C

解題說明：
Cisco 8000Series routers are primarily designed for service provider and web-scale networks, offering high- performance routing capabilities to handle large-scale, high-bandwidth environments typically found in service provider infrastructures and data centers.
The Cisco 8000 Series routers are part of Cisco's high-performance routing portfolio. As documented in the official Cisco product and FLDTEC study materials:
Cisco 8000 Series routers are purpose-built for service provider and cloud-scale datacenters.
They are designed to support massive bandwidth, 5G core, and edge routing demands.
These routers provide scalable, high-performance architecture, using Cisco Silicon One ASICs, enabling terabits of throughput with advanced telemetry and network programmability.
Why the other options are incorrect:
A:Remote branches and retail typically use ISR/ASR 1000/1100 Series.
C:Home or small business networks use Cisco RV Series or Meraki MX Series.
D:LAN access/distribution layers in campuses commonly use Catalyst 9000 Series switches or ISR routers, not high-end core routers.
The 8000 Series is typically found in service provider core, data center interconnect, and hyperscale cloud deployments (e.g., Google, Meta, AWS).

問題 #65
Which command is used to download a copied configuration file from a TFTP server to merge it with the running configuration of a replacement Cisco device?

- A. copy tftp: running-config
- B. merge tftp: running-config
- C. load tftp: running-config
- D. copy tftp: startup-config

答案：A

解題說明：
The command copy tftp: running-config is used to retrieve a configuration file from a TFTP server and merge it with the current running configuration of a Cisco device. This operation is additive, meaning it integrates the new configuration commands into the existing running configuration without removing any pre-existing commands unless explicitly overridden.
This method is particularly useful when restoring configurations to a replacement device, as it allows for the seamless integration of necessary settings without disrupting the current operational state.
In contrast, using copy tftp: startup-config would overwrite the startup configuration file, which could lead to unintended consequences upon the next device reload. The options load tftp: running-config and merge tftp: running-config are not valid Cisco IOS commands.
