Free PDF Data-Architect - Salesforce Certified Data Architect Accurate Valid Test Papers

We are dedicated to helping you pass the next certificate exam fast. Data-Architect Exam Braindumps contains questions and

answers, and they will be enough for you to deal with your exam. Data-Architect exam dumps have most of knowledge points of the exam. In the process of practicing, you can also improve your ability. Furthermore, we provide you with free demo for you to have a try before purchasing, so that you can have a better understanding of what you are going to buy. If you indeed have questions, just contact our online service staff.

Salesforce Data-Architect (Salesforce Certified Data Architect) Certification Exam is a highly advanced certification program designed to validate the skills of experienced data architects in the Salesforce ecosystem. Salesforce Certified Data Architect certification exam is designed to test the candidates' knowledge and expertise in various areas, including data modeling, data architecture, data integration, data governance, and data security. Data-Architect exam is ideal for data architects, data engineers, data analysts, and other professionals who work with Salesforce data on a regular basis.

Salesforce Data-Architect Certification Exam consists of 60 multiple-choice questions and 5 non-scored questions. You will have 105 minutes to complete the exam, and you must achieve a score of 65% or higher to pass. Data-Architect exam covers a range of topics, including data modeling, data management, data governance, data security, and data quality.

Salesforce Certified Data Architect Sample Questions (Q205-Q210):

NEW QUESTION # 205

What 2 data management policies does the data classification feature allow customers to classify in salesforce? Choose 2 answers:

- A. Data sensitivity level
- B. Reference data policy.
- C. Compliance categorization policy.
- D. Data governance policy.

Answer: A,C

Explanation:

The data classification feature allows customers to classify their data in Salesforce based on two policies:

Data sensitivity level: This policy defines how sensitive the data is and what level of protection it requires. For example, high sensitivity data may require encryption or masking.

Compliance categorization policy: This policy defines how the data is regulated by various laws and standards. For example, GDPR or PCI DSS.

NEW QUESTION # 206

A customer is facing locking issues when importing large data volumes of order records that are children in a master-detail relationship with the Account object. What is the recommended way to avoid locking issues during import?

- A. Change the relationship to Lookup and update the relationship to master-detail after import.
- B. Import Order records and Account records separately and populate AccountID in orders using batch Apex.
- C. Import Account records first followed by order records after sorting orders by AccountID.
- D. Import Account records first followed by order records after sorting order by OrderID.

Answer: C

NEW QUESTION # 207

Universal Containers (UC) has an Application custom object, which has tens of millions of records created in the past 5 years. UC needs the last 5 years of data to exist in Salesforce at all times for reporting and queries.

UC is currently encountering performance issues when reporting and running queries on this Object using date ranges as filters. Which two options can be used to improve report performance?

- A. Ask support to create a skinny table for Application with the necessary reporting fields.
- B. Run multiple reports to get different pieces of the data and combine them.
- C. Add custom indexes to all fields on Application without a standard index.
- D. Add custom indexes to the Date fields used for filtering the report.

Answer: A,D

Explanation:

Ask support to create a skinny table for Application with the necessary reporting fields. This is an option that can improve report performance by creating a custom table that contains frequently used fields and copies their values from standard or custom objects. Skinny tables are kept in sync with their source tables and are used in place of them for reports and queries. Add custom indexes to the Date fields used for filtering the report. This is another option that can improve report performance by creating custom indexes on fields that are often used as filters or join conditions in reports and queries. Custom indexes can speed up data retrieval and reduce query execution time

NEW QUESTION # 208

Universal Container is using Salesforce for Opportunity management and enterprise resource planning (ERP) for order management. Sales reps do not have access to the ERP and have no visibility into order status.

What solution a data architect recommends to give the sales team visibility into order status?

- A. Build batch jobs to push order line items to salesforce.
- B. Leverage Canvas to bring the order management UI in to the Salesforce tab.
- C. leverage Salesforce Connect to bring the order line item from the legacy system to Salesforce.
- D. Build real-time integration to pull order line items into Salesforce when viewing orders.

Answer: C

NEW QUESTION # 209

Universal Container (US) is replacing a home-grown CRM solution with Salesforce, UC has decided to migrate operational (Open and active) records to Salesforce, while keeping historical records in legacy system, UC would like historical records to be available in Salesforce on an as needed basis.

Which solution should a data architect recommend to meet business requirement?

- A. Leverage mashup to display historical records in Salesforce.
- B. Bring all data Salesforce, and delete it after a year.
- C. Build a chair solution to go the legacy system and display records.
- D. Leverage real-time integration to pull records into Salesforce.

Answer: A

Explanation:

According to the Using Mashups article on Salesforce Developers, one of the techniques for deploying large data volumes is to use mashups to display historical records in Salesforce. The article states that "Mashups are a way to display data from an external system within a Salesforce page without copying or synchronizing the data. Mashups use a combination of Visualforce, Apex callouts, and JavaScript code that runs in the browser. Mashups are useful when you want to display large amounts of read-only data that is stored outside of Salesforce." Therefore, a data architect should recommend this solution to meet the business requirement of UC.
