100% パスレート Amazon SAA-C03試験勉強攻略 & 完璧な ShikenPASS -

認定試験のリーダー

すべてのお客様が快適に過ごせるように、当社はすべてのお客様に完璧で思いやりのあるサービスを提供することをお約束します。当社からSAA-C03トレーニングファイルを購入すると、完璧なサービスを楽しむ権利があります。SAA-C03学習教材についてご質問がありましたら、いつでもお気軽にご質問ください。SAA-C03学習問題の使用をサポートさせていただきます。私たちの完璧なサービスは、SAA-C03試験の準備をされていて、あなたがSAA-C03試験に合格すると安心できると信じています。

Amazon AWS Certified Solutions Architect - Associate 認定 SAA-C03 試験 問題 (Q127-Q132):

質問 # 127

A company has applications that run on Amazon EC2 instances in a VPC. One of the applications needs to call the Amazon S3 API to store and read objects. According to the company's security regulations, no traffic from the applications is allowed to travel across the internet. Which solution will meet these requirements?

- A. Create an S3 bucket in a private subnet.
- B. Configure a NAT gateway in the same subnet as the EC2 instances.
- **C. Configure an S3 gateway endpoint.**
- D. Create an S3 bucket in the same AWS Region as the EC2 instances.

正解: C

解説:

VPC Endpoint for S3: A gateway endpoint for Amazon S3 enables you to privately connect your VPC to S3 without requiring an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection.

Configuration Steps:

In the VPC console, navigate to "Endpoints" and create a new endpoint.

Select the service name for S3 (com.amazonaws.region.s3).

Choose the VPC and the subnets where your EC2 instances are running.

Update the route tables for the selected subnets to include a route pointing to the endpoint.

Security Compliance: By configuring an S3 gateway endpoint, all traffic between the VPC and S3 stays within the AWS network, complying with the company's security regulations to avoid internet traversal.

質問 # 128

A company has applications that run in an organization in AWS Organizations. The company outsources operational support of the applications. The company needs to provide access for the external support engineers without compromising security. The external support engineers need access to the AWS Management Console. The external support engineers also need operating system access to the company's fleet of Amazon EC2 instances that run Amazon Linux in private subnets. Which solution will meet these requirements MOST securely?

- A. Create a bastion host in a public subnet. Set up the bastion host security group to allow access from only the external engineers' IP address ranges. Ensure that all instances have a security group that allows SSH access from the bastion host. Provide each external support engineer an SSH key pair to log in to the application instances. Provide local account IAM user credentials to the engineers for console access.
- B. Confirm that all instances have a security group that allows SSH access only from the external support engineers source IP address ranges. Provide local IAM user credentials in each AWS account to the external support engineers for console access. Provide each external support engineer an SSH key pair to log in to the application instances.
- C. Confirm that AWS Systems Manager Agent (SSM Agent) is installed on all instances. Assign an instance profile with the necessary policy to connect to Systems Manager. Use Systems Manager Session Manager to provide local IAM user credentials in each AWS account to the external support engineers for console access.
- **D. Confirm that AWS Systems Manager Agent (SSM Agent) is installed on all instances. Assign an instance profile with the necessary policy to connect to Systems Manager. Use AWS IAM IdentityCenter to provide the external support engineers console access. Use Systems Manager Session Manager to assign the required permissions.**

正解: D

解説:

This solution provides the most secure access for external support engineers with the least exposure to potential security risks.

AWS Systems Manager (SSM) and Session Manager: Systems Manager Session Manager allows secure and auditable access to EC2 instances without the need to open inbound SSH ports or manage SSH keys. This reduces the attack surface significantly. The SSM Agent must be installed and configured on all instances, and the instances must have an instance profile with the necessary IAM permissions to connect to Systems Manager.

IAM Identity Center: IAM Identity Center provides centralized management of access to the AWS Management Console for external support engineers. By using IAM Identity Center, you can control console access securely and ensure that external engineers have the appropriate permissions based on their roles.

Why Not Other Options?

Option B (Local IAM user credentials): This approach is less secure because it involves managing local IAM user credentials and does not leverage the centralized management and security benefits of IAM Identity Center.

Option C (Security group with SSH access): Allowing SSH access opens up the infrastructure to potential security risks, even when restricted by IP addresses. It also requires managing SSH keys, which can be cumbersome and less secure.

Option D (Bastion host): While a bastion host can secure SSH access, it still requires managing SSH keys and opening ports. This approach is less secure and more operationally intensive compared to using Session Manager.

質問 # 129

A company is hosting a web application from an Amazon S3 bucket. The application uses Amazon Cognito as an identity provider to authenticate users and return a JSON Web Token (JWT) that provides access to protected resources that are stored in another S3 bucket.

Upon deployment of the application, users report errors and are unable to access the protected content. A solutions architect must resolve this issue by providing proper permissions so that users can access the protected content.

Which solution meets these requirements?

- **A. Update the S3 ACL to allow the application to access the protected content**
- B. Update the Amazon Cognito pool to use custom attribute mappings within the Identity pool and grant users the proper permissions to access the protected content
- C. Redeploy the application to Amazon S3 to prevent eventually consistent reads in the S3 bucket from affecting the ability of users to access the protected content.
- D. Update the Amazon Cognito identity pool to assume the proper IAM role for access to the protected content.

正解: A

質問 # 130

A company needs to run a critical data processing workload that uses a Python script every night. The workload takes 1 hour to finish.

Which solution will meet these requirements MOST cost-effectively?

- A. Deploy an Amazon Elastic Container Service (Amazon ECS) cluster with the Amazon EC2 launch type. Schedule the job to run once every night.
- B. Create an Amazon EC2 On-Demand Instance that runs Amazon Linux. Migrate the Python script to the instance. Use a cron job to schedule the script. Create an AWS Lambda function to start and stop the instance once every night.
- C. Create an AWS Lambda function that uses the existing Python code. Configure Amazon EventBridge to invoke the function once every night.
- **D. Deploy an Amazon Elastic Container Service (Amazon ECS) cluster with the AWS Fargate launch type. Use the Fargate Spot capacity provider. Schedule the job to run once every night.**

正解: D

解説:

AWS Fargate with Spot capacity is the most cost-effective and serverless container option for short-duration jobs that are flexible on start time. Since the job is not latency-critical and runs nightly, it is a good candidate for Fargate Spot, which can offer up to 70% cost savings over On-Demand pricing.

The job runs for 1 hour, which exceeds the AWS Lambda maximum execution time (15 minutes). Therefore, Lambda is not suitable. EC2-based solutions involve higher operational overhead and cost, making Fargate Spot the best low-cost, low-maintenance solution.

質問 # 131

A company's web application is running on Amazon EC2 instances behind an Application Load Balancer. The company recently changed its policy, which now requires the application to be accessed from one specific country only. Which configuration will meet this requirement?

- **A. Configure AWS WAF on the Application Load Balancer in a VPC.**
- B. Configure the security group on the Application Load Balancer.
- C. Configure the security group for the EC2 instances.
- D. Configure the network ACL for the subnet that contains the EC2 instances.

正解: A

解説:
