

# ISQI CTAL-TAE Dumps Material Formats

DOWNLOAD the newest TorrentVCE CTAL-TAE PDF dumps from Cloud Storage for free: [https://drive.google.com/open?id=10o-YWYU1ld368drBAXQ\\_3V4udMAIXVi](https://drive.google.com/open?id=10o-YWYU1ld368drBAXQ_3V4udMAIXVi)

Whether you are a student or a professional who has already taken part in the work, you must feel the pressure of competition now. However, no matter how fierce the competition is, as long as you have the strength, you can certainly stand out. It's not easy to become better. Our CTAL-TAE exam questions can give you some help. After using our CTAL-TAE Study Materials, you can pass the CTAL-TAE exam faster and you can also prove your strength. Of course, our CTAL-TAE study materials can bring you more than that. You will have a brighter future with the help of our CTAL-TAE exam questions.

The CTAL-TAE Certification Exam covers a wide range of topics related to test automation engineering, such as test automation design, implementation and maintenance, test automation frameworks, and scripting languages. CTAL-TAE exam also tests a candidate's understanding of software testing techniques, test management, and risk-based testing. ISTQB Certified Tester Advanced Level, Test Automation Engineering certification exam is designed to assess a candidate's ability to apply these concepts in real-world scenarios.

## Best CTAL-TAE Practice & New CTAL-TAE Test Sample

If you choose to register ISQI CTAL-TAE certification exam, you must try to get the CTAL-TAE certification. If you are apprehensive of defeat, you can select TorrentVCE ISQI CTAL-TAE dumps. No matter what your qualification and your ability are, you can grasp these knowledge easily. TorrentVCE ISQI CTAL-TAE Test Questions and answers is the latest. We provide you with free update for one year. After using it, you will make a difference.

## ISQI ISTQB Certified Tester Advanced Level, Test Automation Engineering Sample Questions (Q75-Q80):

### NEW QUESTION # 75

A SUT (SUT1) is a client-server system based on a thin client. The client is primarily a display and input interface, while the server provides almost all the resources and functionality of the system. Another SUT (SUT2) is a client-server system based on a fat client that relies little on the server and provides most of the resources and functionality of the system. A given TAS is used to implement automated tests on both SUT1 and SUT2. The main objective of the TAS is to cover as many system functionalities as possible through automated tests executed as fast as possible. Which of the following statements about the automation solution is BEST in this scenario?

- A. The TAS should support mainly client-side automation for SUT1 and server-side automation for SUT2

- B. The TAS should support mainly server-side automation for both SUT1 and SUT2
- **C. The TAS should support mainly server-side automation for SUT1 and client-side automation for SUT2**
- D. The TAS should support mainly client-side automation for both SUT1 and SUT2

**Answer: C**

Explanation:

TAE promotes selecting automation interfaces that maximize speed, robustness, and functional coverage while minimizing unnecessary UI traversal. For a thin client architecture, most business logic and system functionality resides on the server. To cover functionality efficiently, tests should interact as close as possible to where the logic is implemented—typically via server-side interfaces (e.g., APIs/services, backend endpoints, message interfaces). This reduces GUI overhead and accelerates execution while improving reliability. For a fat client, substantial logic resides on the client side; server-side automation alone may miss critical client behavior, validations, local processing, and UI-driven flows that embody much of the functionality. In such cases, client-side automation (often UI automation or client-level interfaces) is more directly aligned to achieving high functional coverage. TAE also highlights that the "best" interface depends on where behavior is implemented and which interface yields the most stable, fastest checks for the targeted risks. Therefore, the optimal combination is server-side automation for SUT1 (thin client) and client-side automation for SUT2 (fat client), which best meets the goal of broad coverage with minimal execution time.

#### NEW QUESTION # 76

Consider a TAS aimed at implementing and running automated test scripts at the UI level on web apps. The TAS must support cross-browser compatibility for a variety of supported browsers, by ensuring that the same test script will run on such browsers in the same way without making any changes to it. This is achieved by introducing appropriate abstractions into the TAA for connection and interaction with different browsers.

Because of this, the TAS will be able to make direct calls to the supported browsers using each different browser's native support for automation. Which of the following SOLID principles was adopted?

- A. Open-closed principle
- B. Liskov substitution principle
- **C. Dependency inversion principle**
- D. Interface segregation principle

**Answer: C**

Explanation:

The scenario describes introducing abstractions so that test scripts do not depend directly on concrete browser-specific automation implementations. Instead, tests depend on an abstraction (e.g., a "BrowserDriver" interface), while each concrete browser implementation (Chrome, Firefox, Edge, etc.) provides its own adapter using native automation support. This is a classic application of the Dependency Inversion Principle (DIP): high-level modules (test scripts and business-level actions) should not depend on low-level modules (specific browser drivers); both should depend on abstractions. Additionally, details (browser-specific integrations) depend on the abstraction, not the reverse. TAE emphasizes that this reduces coupling and improves maintainability: you can add or update browser implementations with minimal impact on test definitions. While Open-Closed is also supported (extending with new browser adapters without modifying existing tests), the key phrase "introducing appropriate abstractions" specifically to decouple tests from concrete drivers is DIP. Liskov Substitution relates to substituting implementations without breaking correctness, and Interface Segregation concerns keeping interfaces small and specific—neither is as directly targeted by the described architectural decoupling. Therefore, the SOLID principle most clearly adopted is Dependency Inversion.

#### NEW QUESTION # 77

A SUT has an existing automated test suite.

Which of the following statements relating to the introduction of new features in the SUT is TRUE?

- A. The test automation engineer should work with the business analysts to ensure the new feature is testable
- **B. Automated tests are not affected by the introduction of a new feature and running them against the new SUT is a waste of effort**
- C. It is generally more difficult to automate test cases for a new feature as the development has not yet started
- D. The introduction of a new feature could require updates or additions to the testware components

**Answer: B**

### NEW QUESTION # 78

Assume that you are the TAE responsible for the correct functioning of a TAS, deployed in a test environment that consists of a few machines running the same version of the operating system. The TAS has been working and stable since its deployment, it has been used to run an automated test suite consisting of many similar automated test. The infrastructure team is planning to update the operating system on these machines by installing a new service pack for security reasons. Since the vendor of the operating system assures full backward compatibility, the infrastructure team assures that there will be no impacts on the functioning of the TAS.

What is the BEST approach to confirm the correct functioning of the TAS in this scenario?

- A. Verify the behavior of the whole automated test suite by running all the automated tests
- B. Make sure that the infrastructure team has completed installing the service pack on the machines where SUT is running, then run the whole automated test suite to verify its behavior
- C. Do not run any tests because you can immediately confirm the correct functioning of the automated test suite
- **D. Verify the behavior of the automated tests by running a small tests, then gradually run the remaining tests to confirm the correct functioning of the whole automated test suite.**

**Answer: D**

### NEW QUESTION # 79

Some automated regression test scripts run by a TAS in a given test environment make calls to private APIs that require authentication for all requests (the authentication method is the same for all APIs). The SUT is a business-critical system. The following two changes are planned: a change in the authentication method of all APIs and a minor upgrade of the OS (Operating System) in the test environment. You have updated the test scripts to cope with the change in the API authentication method. Which of the following sequences of activities is BEST to ensure that the test scripts are not adversely affected by these changes?

- **A. Implement one change at a time and run a subset of the updated test scripts after each change, and finally run all the updated test scripts**
- B. First upgrade the OS, then implement the change in the API authentication method, and finally run all the updated test scripts
- C. First implement the change in the API authentication method, then upgrade the OS, and finally run all the updated test scripts
- D. Implement one change at a time and run a subset of the updated test scripts after each change

**Answer: A**

Explanation:

TAE recommends controlled change management to isolate causes when multiple changes are introduced.

When you apply more than one change at once, diagnosing failures becomes harder because you cannot easily attribute effects to a specific change. The best practice is to implement changes incrementally, validating automation and system behavior after each change using a representative subset of tests (e.g., smoke/build verification or targeted regression) to quickly detect issues. Because the system is business-critical, risk mitigation is stronger: you want early detection and clear attribution. After each change is validated with a subset, you then execute the full updated regression suite to ensure overall coverage and confidence. Options A and C apply two changes before running tests, which reduces diagnostic clarity and increases the risk of late discovery. Option D describes incremental changes with subset testing but omits the final full-suite run, which TAE would recommend to ensure broad coverage after all changes have been applied. Therefore, the best sequence is: change one item, run a subset, repeat for the next change, then run all updated scripts.

### NEW QUESTION # 80

.....

We update our CTAL-TAE test prep within one year and you will download free which you need. After one year, we provide the client 50% discount benefit if buyers want to extend their service warranty so you can save much money. If you are the old client, you can enjoy some certain discount when buying CTAL-TAE Exam Torrent so you can enjoy more service and more benefits. Our update can provide the latest and most useful CTAL-TAE prep torrent to you and you can learn more and pass the CTAL-TAE exam successfully.
