

1Z0-1151-25 Valid Test Cost, Exam 1Z0-1151-25 Pass Guide

What's more, part of that Pass4SureQuiz 1Z0-1151-25 dumps now are free: <https://drive.google.com/open?id=1a3frAT03ebHtzwpYFYBLAnHjq1J5Vg>

Our 1Z0-1151-25 learning guide boasts many advantages and it is worthy for you to buy it. You can have a free download and tryout of our 1Z0-1151-25 exam torrents before purchasing. After you purchase our product you can download our 1Z0-1151-25 study materials immediately. We will send our product by mails in 5-10 minutes. We provide free update and the discounts for the old client. Our 1Z0-1151-25 Exam Materials boost high passing rate. The 1Z0-1151-25 learning prep costs you little time and energy and you can commit yourself mainly to your jobs or other important things.

Oracle 1Z0-1151-25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Implement Oracle Database@Azure: This section tests the expertise of Database Solutions Architects in deploying and managing Oracle Database@Azure. It covers the architectural components and onboarding processes required for provisioning databases in Azure while maintaining Oracle's advanced database capabilities. Candidates will also focus on configuring high availability and disaster recovery strategies to ensure business continuity and data resilience in a multi-cloud setup.
Topic 2	<ul style="list-style-type: none"> Configure Multicloud Connection Options: This section assesses the abilities of Network Engineers in configuring connectivity solutions for OCI multi-cloud environments. It includes setting up secure networking options such as Site-to-Site VPN and FastConnect for seamless cloud integration. Candidates will also learn how to implement Oracle Interconnect services for establishing direct, high-performance connections between OCI and third-party cloud providers like Microsoft Azure and Google Cloud.
Topic 3	<ul style="list-style-type: none"> Introduction to Multicloud: This section of the exam measures the skills of Cloud Architects in understanding multicloud environments and their benefits. It covers the reasons organizations adopt multi-cloud strategies, including flexibility, cost optimization, and risk management. Candidates will learn about common multicloud use cases and how they are implemented in Oracle Cloud Infrastructure (OCI) to enhance interoperability and performance.

Topic 4	<ul style="list-style-type: none"> • Core OCI Services Overview: This section evaluates the knowledge of Identity and Database Administrators in managing OCI's core services for multi-cloud integration. It covers the implementation of identity federation between OCI Identity Domains and external identity providers, ensuring secure authentication across multiple cloud environments. Candidates will also gain expertise in configuring Virtual Cloud Network (VCN) components and administering OCI database services, including Base Databases, Autonomous Databases, and HeatWave, to support scalable multi-cloud deployments.
Topic 5	<ul style="list-style-type: none"> • Implement Oracle Database@Google Cloud: This section measures the proficiency of Cloud Database Engineers in utilizing Oracle Database@Google Cloud. It explores the architecture and operational framework for running Oracle databases on Google Cloud. Candidates will learn about onboarding procedures, provisioning resources, and managing database services effectively to optimize performance and availability in a Google Cloud-integrated multi-cloud ecosystem.

Exam 1Z0-1151-25 Pass Guide & 1Z0-1151-25 Online Version

Our 1Z0-1151-25 exam prep is subservient to your development. And our experts generalize the knowledge of the 1Z0-1151-25 exam into our products showing in three versions. PDF version of 1Z0-1151-25 learning quiz can support customers' printing request and Software version can support simulation test system. App/online version of 1Z0-1151-25 Training Materials can be suitable to all kinds of equipment or digital devices. You can choose your most desirable way to practice on the daily basis.

Oracle Cloud Infrastructure 2025 Multicloud Architect Professional Sample Questions (Q56-Q61):

NEW QUESTION # 56

ABC company has a strict security policy requiring multi-factor authentication (MFA) for all access to cloud resources. You are federating OCI with an identity provider that already enforces MFA. How can you ensure MFA is enforced for OCI access?

- A. Implement a separate MFA solution in front of OCI.
- **B. Rely on the IdP's existing MFA implementation.**
- C. MFA is not possible with federated access.
- D. Configure MFA directly within the OCI Identity Domain.

Answer: B

Explanation:

Here's why:

When you federate OCI with an identity provider (IdP) that already enforces MFA, you should leverage that existing implementation. This is the most efficient and secure way to ensure MFA for OCI access. Here's how it works:

User Authentication at the IdP: The user first attempts to access an OCI resource. They are redirected to the IdP for authentication.

IdP MFA Enforcement: The IdP prompts the user for their primary credentials (username/password) and then enforces its MFA process (e.g., TOTP, push notifications, biometrics).

SAML Assertion with Authentication Context: Upon successful authentication (including MFA), the IdP issues a SAML assertion. This assertion includes an Authentication Context that explicitly states that MFA was used.

OCI Trust and Enforcement: OCI trusts the IdP's authentication and accepts the SAML assertion. Because the assertion contains the Authentication Context indicating MFA, OCI recognizes that the user has already completed MFA and grants access.

Why the other options are incorrect:

A). Configure MFA directly within the OCI Identity Domain: If you are federating, you should not configure MFA within OCI for the federated users. Doing so would create a redundant and potentially conflicting MFA process. The purpose of federation is to centralize identity management and authentication at the IdP.

C). Implement a separate MFA solution in front of OCI: This is also redundant and adds unnecessary complexity. It would require managing two separate MFA solutions, which increases administrative overhead and could lead to inconsistencies.

D). MFA is not possible with federated access: This is incorrect. MFA is absolutely possible and commonly used with federated access.

The key is to leverage the IdP's existing MFA capabilities.

NEW QUESTION # 57

A company XYZ has been using Oracle Cloud Infrastructure to host their mission-critical applications, but they have decided to start using Azure for some of their workloads. They want to enable connectivity between their Oracle Cloud Infrastructure and Microsoft Azure to create a multicloud architecture.

- A. Use public Internet to connect the two clouds.
- B. Use a VPN connection to connect the two clouds.
- C. Use OCI-Azure Interconnect to establish a private, high-bandwidth, low-latency connection between the two clouds.
- D. None of the above.

Answer: C

Explanation:

The OCI-Azure Interconnect is the official Oracle-Microsoft partnership solution for establishing a private, high-bandwidth, and low-latency connection between OCI and Azure. This interconnect leverages Azure ExpressRoute and Oracle FastConnect to create a dedicated network link, bypassing the public internet for enhanced security and performance. A VPN connection (Option A) is possible but less optimal due to higher latency and lower reliability compared to the interconnect. Using the public internet (Option B) is insecure and unsuitable for mission-critical applications. This solution is detailed in Oracle's multicloud architecture guides and the OCI-Azure partnership documentation, emphasizing its suitability for enterprise multicloud deployments.

NEW QUESTION # 58

Which of the following is not a primary driver for using multiple clouds?

- A. Cost Optimization
- B. Best of Breed Cloud Services
- C. Content Delivery Network
- D. Redundancy/Disaster Recovery

Answer: C

Explanation:

While a CDN can be part of a multi-cloud strategy, it's not a primary driver for adopting one. Here's why:

CDNs are about content delivery: Their main function is to cache and deliver content (like images, videos, and web pages) to users from geographically distributed servers, improving performance and reducing latency.

CDNs can be used independently of multi-cloud: You can use a CDN with a single cloud provider or even with on-premises infrastructure.

Here's why the other options are primary drivers:

Cost Optimization: Different cloud providers have different pricing models and strengths. Multi-cloud allows you to choose the most cost-effective option for each workload.

Best of Breed Cloud Services: Each cloud provider has its own unique strengths and specialized services. Multi-cloud lets you leverage the best services from each provider.

Redundancy/Disaster Recovery: Using multiple clouds provides redundancy and reduces the risk of a single point of failure.

If one cloud experiences an outage, you can failover to another.

NEW QUESTION # 59

A company wants to leverage Google Cloud's AI/ML services for analyzing data stored in Oracle Autonomous Database on OCI. Which approach minimizes data egress costs and latency for this multicloud analytics use case?

- A. Use Oracle Data Integration Platform Cloud (DIPC) to replicate the data to a Google Cloud SQL instance.
- B. Use a third-party ETL tool to extract data from Autonomous Database and load it into Google BigQuery.
- C. Export data from Autonomous Database to Google Cloud Storage regularly using Data Pump.
- D. Leverage Oracle Interconnect for Google Cloud to establish a direct, low-latency connection and access Autonomous Database remotely from Google Cloud's AI/ML services.

Answer: D

Explanation:

Here's why:

Oracle Interconnect for Google Cloud: This service provides a dedicated, private connection between OCI and Google Cloud. This direct interconnection minimizes latency significantly compared to transferring data over the public internet. Crucially, it also avoids data egress charges from OCI, as the data remains within the interconnected network. This is the key advantage for cost optimization. By accessing the database remotely, you are processing the data in place, avoiding any transfer costs from OCI. Why other options are less optimal:

- A). Export data from Autonomous Database to Google Cloud Storage regularly using Data Pump: This involves transferring large amounts of data across the public internet, incurring egress costs from OCI. It also introduces latency due to the data transfer process. Regular exports also mean data is not live and can be outdated.
- B). Use Oracle Data Integration Platform Cloud (DIPC) to replicate the data to a Google Cloud SQL instance: Similar to option A, this involves data transfer and replication, incurring egress costs from OCI and introducing latency. Maintaining a replicated database also adds complexity and cost.
- D). Use a third-party ETL tool to extract data from Autonomous Database and load it into Google BigQuery: This option also requires data extraction and loading, resulting in egress costs from OCI and increased latency. Using a third-party tool also adds another layer of cost and management.

NEW QUESTION # 60

What is the function of a NAT Gateway in an OCI VCN?

- A. To balance network traffic across multiple instances in a subnet.
- B. To provide DNS resolution for instances within the VCN.
- C. To provide a secure tunnel for connecting to on-premises networks.
- D. To allow instances in private subnets to initiate outbound connections to the internet without having public IP addresses.

Answer: D

Explanation:

Here's a breakdown of the function of a NAT Gateway in OCI:

Outbound Internet Access for Private Subnets: The primary purpose of a NAT Gateway is to enable instances in private subnets (subnets without direct internet access) to initiate outbound connections to the internet. This is crucial for tasks like downloading software updates, accessing external APIs, or connecting to other internet-based services.

No Public IP Required: Instances in private subnets using a NAT Gateway do not need to have public IP addresses assigned to them. This enhances security by preventing direct inbound connections from the internet to these instances.

NAT Functionality: The NAT Gateway performs Network Address Translation (NAT), which translates the private IP addresses of the instances to a public IP address owned by the NAT Gateway when they initiate outbound connections. When the responses come back from the internet, the NAT Gateway translates the destination IP address back to the private IP address of the originating instance.

Why the other options are incorrect:

- A). To provide a secure tunnel for connecting to on-premises networks: Secure tunnels to on-premises networks are provided by VPN Connect or FastConnect, not a NAT Gateway.
- C). To balance network traffic across multiple instances in a subnet: Network traffic load balancing is handled by Load Balancers, not a NAT Gateway.
- D). To provide DNS resolution for instances within the VCN: DNS resolution is provided by a DNS Resolver within the VCN, not a NAT Gateway.

NEW QUESTION # 61

.....

Pass4SureQuiz has been on the top of the industry over 10 years with its high-quality 1Z0-1151-25 exam braindumps which own high passing rate up to 98 to 100 percent. Ranking the top of the similar industry, we are known worldwide by helping tens of thousands of exam candidates around the world pass the 1Z0-1151-25 Exam. To illustrate our 1Z0-1151-25 exam questions better, you can have an experimental look of them by downloading our demos freely.
