- C. 16-bit number to accompany the IP address.
- **D. Layer of hierarchy in the addressing structure.**

Answer: D

NEW QUESTION # 17

Which of the following enables service providers to support multiple customers with the same VLAN ID over the same backbone?

- A. VLAN Tagging
- **B. VLAN Stacking**
- C. VLAN Routing
- D. VLAN Trunking

Answer: B

Explanation:

VLAN Stacking, also known as Q-in-Q tunneling, is a technology that allows multiple customers to use overlapping VLAN IDs while being transported over a shared service provider network.

Key Concepts:

* Customer VLAN (C-VLAN): The VLAN used by the customer in their own network.

* Service VLAN (S-VLAN): The VLAN used by the service provider to encapsulate the customer VLAN.

When VLAN stacking is applied:

* A customer's Ethernet frame already tagged with a C-VLAN is encapsulated with an additional outer S-VLAN tag.

* This way, multiple customers can use the same C-VLAN ID, but remain isolated by the unique S-VLAN assigned to them by the service provider.

Why Other Options Are Incorrect:

* A. VLAN Trunking: Used to carry multiple VLANs over a single physical link but doesn't allow reuse of VLAN IDs across customers.

* C. VLAN Tagging: Refers to the general process of adding a VLAN tag; it doesn't provide the isolation needed across shared infrastructure.

* D. VLAN Routing: Refers to Layer 3 routing between VLANs, not to ID reuse or transport over a shared provider backbone.
