Consistent practice with it relieves exam stress and boosts self-confidence. The web-based NSE7_CDS_AR-7.6 practice exam does not require additional software installation. All operating systems also support this Fortinet NSE 7 - Public Cloud Security 7.6 Architect (NSE7_CDS_AR-7.6) practice test. We update our Fortinet NSE 7 - Public Cloud Security 7.6 Architect (NSE7_CDS_AR-7.6) pdf format regularly so keep calm because you will always get updated Fortinet NSE 7 - Public Cloud Security 7.6 Architect (NSE7_CDS_AR-7.6) questions.

Fortinet NSE7_CDS_AR-7.6 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Security Solutions Deployment: This domain covers deploying Fortinet solutions to protect IaaS and CaaS environments, and integrating them with cloud native security tools.
Topic 2	<ul style="list-style-type: none">• Troubleshooting: This domain involves resolving connectivity issues in AWS and Azure environments, including diagnosing problems with SDN connectors.
Topic 3	<ul style="list-style-type: none">• Automation Tools: This domain focuses on using infrastructure-as-code tools like Terraform, Ansible, Azure Bicep, and AWS CloudFormation to automate cloud infrastructure and Fortinet solution deployments.

- Cloud Infrastructure Monitoring: This domain addresses monitoring AWS and Azure networks using Fortinet monitoring tools designed for cloud workload visibility and management.

Fortinet NSE 7 - Public Cloud Security 7.6 Architect Sample Questions (Q40-Q45):

NEW QUESTION # 40

In an SD-WAN TGW Connect topology, which three initial steps are mandatory when routing traffic from a spoke VPC to a security VPC through a Transit Gateway? (Choose three.)

- A. From the security VPC FortiGate internal subnet routing table, point 0.0.0.0/0 traffic to the TGW.
- B. From both spoke VPCs, and the security VPC, point 0.0.0.0/0 traffic to the Internet Gateway.
- C. From the security VPC TGW subnet routing table, point 0.0.0.0/0 traffic to the FortiGate internal port.
- D. From the security VPC TGW subnet routing table, point 0.0.0.0/0 traffic to the TGW.
- E. From the spoke VPC internal routing table, point 0.0.0.0/0 traffic to the TGW.

Answer: A,C,E

Explanation:

Comprehensive and Detailed Explanation From FortiOS 7.6, FortiWeb 7.4 Exact Extract study guide:

In an AWS SD-WAN Transit Gateway (TGW) Connect topology, traffic flow must be meticulously orchestrated through VPC route tables to ensure that the FortiGate-VM (Security VPC) can inspect traffic transitioning between spokes.

* Spoke to TGW Redirection (Option E): For traffic to leave a Spoke VPC and reach the inspection hub, the Spoke VPC internal routing table must be configured to send all non-local traffic (0.0.0.0/0) to the Transit Gateway (TGW). This is the first step in the traffic chain.

* TGW to FortiGate Redirection (Option A): Once the traffic arrives at the TGW and is forwarded to the Security VPC via a TGW attachment, it lands in the TGW subnet (or attachment subnet). To ensure this traffic is inspected, the Security VPC TGW subnet routing table must point the default route (0.0.0.0/0) to the FortiGate's internal network interface (ENI).

* FortiGate Return/Egress Path (Option D): After the FortiGate processes the packet, it must be sent back to the TGW to reach its final destination in a different spoke or to exit via a different gateway.

Therefore, the Security VPC FortiGate internal subnet routing table (the subnet where the FortiGate's internal leg resides) must have a default route (0.0.0.0/0) pointing back to the TGW.

Why other options are incorrect:

* Option B: If the Security VPC TGW subnet routing table points to the TGW as the next hop, it creates a routing loop where traffic arrives from the TGW and is immediately sent back without being inspected by the FortiGate.

* Option C: Pointing all traffic to an Internet Gateway (IGW) would bypass the Transit Gateway entirely and send traffic to the public internet rather than through the internal security fabric.

NEW QUESTION # 41

You are investigating an attack path for a top risky host. You notice that the Common Vulnerability Scoring System (CVSS) and the vulnerability impact scores are very high. However, the attack path severity for the top risky host itself is low. Which two pieces of contextualized information can help you understand why?

(Choose two answers)

- A. The vulnerability score

- B. The fix version
- C. The FortiCNAPP risk score
- D. The package status

Answer: C,D

NEW QUESTION # 42

A VM in Azure is failing to communicate with other VMs in the same subnet. What is the most likely cause?

- A. A network security group (NSG) has overridden the default intrasubnet communication rule.
- B. The VMs do not have a public IP address configured.
- C. There is at least one user-defined route blocking traffic within the subnet.
- D. Some of the VMs are beyond your allowed quota for the Azure region.

Answer: A

Explanation:

In Azure, VMs in the same subnet can communicate by default. If communication fails, it is usually because an NSG has overridden the default allow-intrasubnet rule, blocking traffic between the VMs.

NEW QUESTION # 43

What is the main advantage of using SD-WAN Transit Gateway Connect over traditional SD- WAN?

- A. You can combine it with IPsec to achieve higher bandwidth.
- B. You can use BGP over IPsec for maximum throughput.
- C. You can use GRE-based tunnel attachments.
- D. It eliminates the use of ECMP.

Answer: C

Explanation:

The main advantage of SD-WAN Transit Gateway Connect is that it supports GRE-based tunnel attachments to AWS Transit Gateway. This provides higher throughput and lower overhead compared to traditional VPN (IPsec) connections, making it more efficient for SD-WAN integration.

NEW QUESTION # 44

What are two main features in Amazon Web Services (AWS) network access control lists (NACLs)? (Choose two answers)

- A. You cannot use NACLs and Security Groups at the same time.
- B. NACLs are stateless, and inbound and outbound rules are used for traffic filtering.
- C. The default NACL is configured to allow all traffic.
- D. NACLs are tied to an instance.

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation From FortiOS 7.6, FortiWeb 7.4 Exact Extract study guide:

As per the FortiOS 7.6 AWS Administration Guide and FortiWeb 7.4 cloud deployment documentation, understanding the AWS infrastructure layer is critical for integrating Fortinet virtual appliances. The two features that define AWS Network Access Control Lists (NACLs) are:

* Stateless Nature (Option A): Unlike Security Groups, which are stateful (automatically allowing return traffic), NACLs are stateless. This means that if you allow inbound traffic on a specific port, you must also explicitly configure an outbound rule to allow the response traffic to leave the subnet. NACLs evaluate inbound and outbound traffic independently.

* Default Configuration (Option C): Every VPC comes with a default NACL. By default, this NACL is configured to allow all inbound and outbound traffic. This is designed to ensure connectivity is not blocked until a custom security posture is defined. However, any custom NACL created manually starts by denying all traffic until rules are added.

Why other options are incorrect:

* Option B: NACLs are associated at the subnet level, not the instance level. Security Groups are the components tied directly to an instance's Elastic Network Interface (ENI).

* Option D: NACLs and Security Groups provided defense-in-depth and are designed to be used simultaneously. Traffic must pass through the NACL (subnet level) and then the Security Group (instance level) to reach its destination.
