UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q75-Q80):

NEW QUESTION # 75

Which of the following stages comes immediately after the Process Analysis stage?

- A. Development and Testing
- B. Business Case and Technical Validation
- **C. Solution Design**
- D. User Acceptance Testing

Answer: C

Explanation:

After the Process Analysis stage, the next step in the UiPath Automation Implementation Methodology is the Solution Design stage. In this stage, the Solution Architect, along with the Automation Developer and Project Manager, uses the insights from the Process Definition Document (PDD) to create a technical blueprint for the automation.

This stage is critical because it translates the "what" from the business process into the "how" in terms of automation design. It involves designing the To-Be process flow, defining technical components, data handling logic, exception paths, and other automation modules. The output of this stage is the Approved Solution Design Document (SDD), which acts as the guideline for developers during the next phase.

The Solution Design phase ensures the automation is scalable, maintainable, and aligned with UiPath best practices. A strong design phase reduces errors, shortens development time, and provides a clear roadmap for testing and deployment.

NEW QUESTION # 76

During which stage is the Process Definition Document (PDD) created?

- A. Kickoff
- B. Solution Design
- C. Business Case and Technical Validation
- **D. Process Analysis**

Answer: D

Explanation:

The Process Definition Document (PDD) is created during the Process Analysis stage. This document is the output of a detailed analysis of the current (As-Is) process, conducted collaboratively by the Business Analyst, Solution Architect, and Client SMEs. In this stage, workshops and shadowing sessions are conducted to gather insights into each step of the process, including decision points, exceptions, inputs, outputs, and system interactions. The purpose is to fully understand how the process works manually before planning automation.

The PDD is then used to validate scope, plan the To-Be design, and prepare for solution development. It serves as a foundational document that reduces ambiguity and ensures all stakeholders are aligned on what is being automated.

NEW QUESTION # 77

Which role is responsible for fixing any defects found during UAT?

- A. Infrastructure Engineer
- **B. Automation Developer**
- C. Business Analyst
- D. Solution Architect

Answer: B

Explanation:

During the User Acceptance Testing (UAT) stage, any defects or issues identified are addressed by the Automation Developer. This role is responsible for building the automation based on the agreed design and then making any required corrections based on UAT feedback.

The automation developer collaborates closely with the business analyst, solution architect, and project manager to ensure that the solution functions correctly in a production-like environment. If testers from the Client Team identify bugs or unexpected behavior, the developer investigates and applies fixes promptly.

Furthermore, the developer must also document changes, update stakeholders, and sometimes revise the test cases or SDD if significant adjustments are made. Their ability to respond quickly and effectively to UAT issues directly influences user confidence and the success of the production rollout.

NEW QUESTION # 78

Who is responsible for managing internal processes and escalations during automation implementation?

- A. Infrastructure Engineer
- **B. Client Team Project Manager**
- C. Solution Architect
- D. Automation Developer

Answer: B

Explanation:

The Client Team Project Manager is responsible for managing internal processes and handling any escalations that may arise during the automation implementation lifecycle. This individual acts as the liaison between the business and the technical Implementation Team, ensuring alignment, timely responses, and that the business requirements are met.

Their key responsibilities include stakeholder communication, ensuring availability of business SMEs (Subject Matter Experts), resolving conflicts, managing dependencies on internal systems or departments, and escalating issues internally when roadblocks occur. This ensures the smooth execution of the project from the business side.

Effective management from the Client Team Project Manager is critical for success, as delays or miscommunications from the business side can stall the implementation timeline or lead to incomplete automation requirements. Their collaboration with the Implementation Team's project manager also ensures project tracking, scope control, and successful delivery within budget and time.

NEW QUESTION # 79

What is the primary responsibility of an Infrastructure Engineer in the UiPath Automation Implementation Methodology?

- A. Developing automation workflows in Studio
- B. Creating the Process Design Document
- C. Managing User Acceptance Testing
- **D. Supporting infrastructure-related issues and integrating the UiPath Platform**

Answer: D

Explanation:

An Infrastructure Engineer plays a critical role in UiPath automation implementations, especially during the Kickoff stage. Their primary responsibility is to support all infrastructure-related aspects of the automation project. This includes setting up the necessary components of the UiPath Platform, such as Orchestrator, robots, Studio, and any required integrations with the client's internal systems.

For external implementations, infrastructure engineers also coordinate with the client's IT and applications teams to ensure that UiPath can be successfully embedded into the client's environment. They address security configurations, access provisioning, software installation, and network requirements.

This role is billable and typically short-term but essential for enabling a technically sound foundation for the automation. Without proper setup, even the most well-designed automation cannot function as intended. The Infrastructure Engineer ensures that developers and robots have the access and infrastructure they need for development, UAT, and production environments.
