## WGU Managing Cloud Security (JY02) Sample Questions (Q27-Q32):

### NEW QUESTION # 27

Which of the following is an iterative software development methodology that focuses on achieving customer satisfaction by delivering the software early in the process and welcoming changing requirements from the customer, even late in the process?

- A. Agile
- B. Lean
- C. Waterfall
- D. Spiral

**Answer: A**

Explanation:

Agile is an iterative software development methodology designed to prioritize customer satisfaction, adaptability, and incremental delivery. Agile teams deliver small, working pieces of software frequently, ensuring feedback is incorporated throughout the process. This flexibility allows late-stage requirement changes to be accommodated without derailing the project.

Waterfall is a sequential approach with limited flexibility. Spiral combines iterative development with risk analysis, but it is not as customer-focused as Agile. Lean emphasizes efficiency and waste reduction but does not center on continuous delivery and adaptability.

Agile frameworks such as Scrum and Kanban embody this philosophy, supporting faster innovation, better collaboration, and responsiveness to evolving business needs.

### NEW QUESTION # 28

An engineer has been given the task of ensuring all of the keys used to encrypt archival data are securely stored according to industry standards. Which location is a secure option for the engineer to store encryption keys for decrypting data?

- A. A repository that is made public
- B. An escrow that is kept separate from the data it is tied to
- C. A repository that is made private
- D. An escrow that is kept local to the data it is tied to

**Answer: B**

Explanation:

Industry best practice requires that encryption keys are stored separately from the data they protect. This ensures that if the data storage system is compromised, attackers cannot immediately decrypt sensitive information. The use of a secure escrow system is a recognized approach.

An escrow provides controlled storage for encryption keys, ensuring they are only accessible by authorized processes and not co-located with the protected data. Keeping keys "local" to the data creates a single point of failure. A public or private repository without specialized protection mechanisms would also be insufficient due to risks of insider threats or misconfiguration.

By placing keys in an independent escrow system, the organization enforces separation of duties, strengthens defense-in-depth, and aligns with cryptographic standards from NIST and ISO. This practice is vital when dealing with archival data, where long-term confidentiality must be preserved even as systems evolve.

### NEW QUESTION # 29

Which U.S. standard is used by federal government agencies to manage enterprise risk?

- A. The Committee of Sponsoring Organizations (COSO) framework
- B. The Statement on Standards for Attestation Engagements 18 (SSAE 18)
- C. International Organization for Standardization (ISO) 37500
- D. The National Institute of Standards and Technology (NIST) SP 800-37

**Answer: D**

Explanation:

Federal agencies in the U.S. rely on NIST SP 800-37, Risk Management Framework (RMF), to manage enterprise risk. RMF provides a structured process for categorizing systems, selecting controls, implementing safeguards, assessing effectiveness, authorizing operations, and continuous monitoring.

ISO 37500 deals with outsourcing governance, SSAE 18 governs service provider audits, and COSO is a corporate governance framework but not specific to federal agencies.

NIST RMF is integrated with the Federal Information Security Modernization Act (FISMA) requirements, ensuring agencies manage cybersecurity risks consistently. Its adoption is expanding beyond government into industries seeking comprehensive, repeatable risk management processes.

#### NEW QUESTION # 30

Which security concept requires continuous identity and authorization checks to allow access to data?

- A. Intrusion prevention
- **B. Zero trust**
- C. Traffic inspection
- D. Secret management

**Answer: B**

Explanation:

The Zero Trust security model assumes that no user, device, or application should be trusted by default, whether inside or outside the network perimeter. Every access request must be continuously verified using strict identity, authorization, and context-based checks. Unlike traditional perimeter security, Zero Trust emphasizes the principle of "never trust, always verify." Traffic inspection looks at data packets, intrusion prevention identifies malicious activity, and secret management safeguards sensitive keys and credentials.

None of these approaches enforce constant, adaptive identity verification the way Zero Trust does.

By adopting Zero Trust, organizations ensure that access is not granted simply because a user is "inside" the network. Instead, continuous checks evaluate credentials, device posture, location, and other risk factors. This significantly reduces the risk of insider threats, credential theft, and lateral movement within cloud environments.

#### NEW QUESTION # 31

Which privacy issue does the Clarifying Lawful Overseas Use of Data (CLOUD) Act address?

- A. Collection and use of genetic information
- B. Use of digital surveillance by multinational employers
- **C. Conflicting regulations in different jurisdictions**
- D. Data breach notification requirements

**Answer: C**

Explanation:

The CLOUD Act addresses conflicts that arise when law enforcement in one jurisdiction seeks access to data stored in another country. It clarifies how U.S. authorities can compel cloud providers to produce data, even if stored overseas, and establishes a framework for resolving jurisdictional conflicts through bilateral agreements.

The Act does not regulate genetic data, breach notifications, or employer surveillance. Its central purpose is to handle the challenge of cross-border data access in the era of globalized cloud computing.

For organizations, this means carefully evaluating how and where data is stored, and ensuring contracts and compliance strategies account for potential conflicts between U.S. law and foreign privacy regulations like GDPR. Awareness of CLOUD Act obligations is crucial in multinational cloud deployments.
