**PL-400 Valid Braindumps Questions - Real PL-400 Braindumps**

NewPassLeader's Microsoft PL-400 practice exam software tracks your performance and provides results on the spot about your attempt. In this way, our Microsoft PL-400 simulation software encourages self-analysis and self-improvement. Questions in the Microsoft PL-400 Practice Test software bear a striking resemblance to those of the real test. This Microsoft PL-400 practice exam software is easily accessible on all Windows laptops and computers.

## Exam Domains

As mentioned, to pass PL-400, the candidate must have the ability to create solution components such as system integration, client user experience, user visualization and automation, and much more. In other words, this official test is based upon seven learning modules. Each of them carries a different weightage and explains a different set of skills such as:

- **Configuring Microsoft Dataverse**

The second exam domain is all about security components, tables and columns, and application lifecycle management including creation, import, and management.

- **Creating a technical design**

Validating requirements and creating technical architecture, solution components designing, and Power Platform extensibility points are what will be tested according to this part.

- **Building & configuring Power Apps**

This domain is the best way to demonstrate competency on model-driven apps, canvas apps, and troubleshooting the apps alongside the use of App Checker and Solution Checker.

- **Developing integrations**

Publishing and consuming events by using the API and the Plug-in Registration Tool, as well as data synchronization implementations are covered by this last exam module.

## Microsoft Power Platform Developer Sample Questions (Q113-Q118):

### NEW QUESTION # 113

You are creating a model-driven app.

Users need to see only the entities in the app navigation that are relevant to their role and their method of accessing the app.

You need to restrict entities on the sub-areas in the SiteMap.

Which properties should you use? To answer, drag the appropriate properties to the correct requirements. Each property may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

#### Answer:

Explanation:

Reference:

<https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/create-site-map-app>

### NEW QUESTION # 114

You create a Power Platform solution to track purchasing requirements for bills of material (BOMs) and their subcomponents.

The solution must meet the following requirements:

\* Ensure that the BOMs are enabled to include the necessary subcomponents.

\* Report changes to the BOMs or their sub-components that are made by engineers.

You need to configure the solution.

What should you do to meet each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

#### Answer:

Explanation:

Explanation:

Box 1: Configure entity relationship

Box 2: Configure entity change tracking

The change tracking feature in Microsoft Dataverse provides a way to keep the data synchronized in an efficient manner by detecting what data has changed since the data was initially extracted or last synchronized. Previously, without this new feature, it was difficult to build a reliable and efficient mechanism to determine what records had changed in Dataverse.

<https://docs.microsoft.com/en-us/powerapps/developer/data-platform/use-change-tracking-synchronize-data-external-systems>

### NEW QUESTION # 115

You create solutions in a development environment and export the solution for testing by various departments in your organization. Power users in each department control the testing environments.

You must display department-specific wording at the beginning of any custom notifications that are displayed in testing environments.

You need to package solutions to ensure that the power users can customize the notification content.

Which three actions should you perform in sequence inside a solution? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

**Answer:**

Explanation:

Explanation

Step 1: Create an empty environment variable named Custom Text Placeholder.

Applications often require different configuration settings or input parameters when deployed to different environments. Environment variables store the parameter keys and values, which then serve as input to various other application objects. Separating the parameters from the consuming objects allows you to change the values within the same environment or when you migrate solutions to other environments.

Step 2: Create a function to retrieve the value from the custom text placeholder and display the notification.

Step 3: Export the solution

You can manually export solutions. Microsoft recommends that you create an unmanaged solution to use for exporting your customizations, and then export your customizations periodically so that you have a backup in case anything happens.

<https://docs.microsoft.com/en-us/powerapps/maker/data-platform/export-solutions>

### NEW QUESTION # 116

You deploy a Power Platform plug-in to a production environment. The plug-in code contains detailed tracing information. You are a member of the Environment Maker security role for the environment.

Users report unexpected results when they interact with confidential data by using the plug-in. You confirm that the plug-in works without errors in a development environment.

You need to investigate the root cause of the plug-in errors.

What should you do?

- A. Send a PUT request to enable plug-in tracing for the production environment.
- **B. Install Plug-in profiler in the production environment by using the Plug-in Registration tool.**
- C. Reproduce and capture the errors, then debug from Visual Studio.
- D. Send a GET request to retrieve the plugintracelogs records.

**Answer: B**

Explanation:

Explanation

Plug-in profiler is a solution that you can install on your environment that enables you to capture the execution context of a plug-in and then use that data to re-play the event within Visual Studio while debugging.

There are two tools available from which to run the Plug-in Profiler:

the Plug-in Registration Tool and Power Platform Tools for Visual Studio.
