NEW QUESTION # 132
While mining the defect database for patterns of problems in the last release, a Test Manager notices that many of the most damaging failures were caused by defects injected during the low-level design phase.
Which of the following actions will likely give this project the most effective solution to this problem? [3]

- A. Mandatory reviews of all important design work products
- B. Formal inspections of the code modules affected by the last release
- C. Increased white-box coverage during system testing
- D. Increased static analysis during the implementation phase

Answer: A

Explanation:
The most effective solution to this problem is to implement mandatory reviews of all important design work products. This is because reviews are a type of static testing technique that can detect and prevent defects early in the software development lifecycle, before they become more costly and difficult to fix. By reviewing the low-level design work products, such as detailed design specifications, the project team can ensure that they are consistent, complete, and correct, and that they meet the requirements and the quality standards.
