It doesn't matter that you can use our TestPassKing dumps.

Salesforce Certified Data Architect Sample Questions (Q27-Q32):

NEW QUESTION # 27

Universal Containers (UC) wants to capture information on how data entities are stored within the different applications and systems used within the company. For that purpose, the architecture team decided to create a data dictionary covering the main business domains within UC. Which two common techniques are used building a data dictionary to store information on how business entities are defined?

- A. Use the Salesforce Metadata API.
- B. Use a data definition language.
- C. Use Salesforce Object Query Language.
- D. Use an entity relationship diagram.

Answer: A,D

NEW QUESTION # 28

In their legacy system, Universal Containers has a monthly accounts receivable report that compiles data from Accounts, Contacts, Opportunities, Orders, and Order Line Items. What difficulty will an architect run into when implementing this in Salesforce?

- A. Salesforce does not support Orders or Order Line Items.
- B. A report cannot contain data from Accounts and Contacts.
- C. Custom report types cannot contain Opportunity data.
- D. Salesforce allows up to four objects in a single report type.

Answer: D

Explanation:

Salesforce allows up to four objects in a single report type. This means that if an architect wants to create a report that compiles data from Accounts, Contacts, Opportunities, Orders, and Order Line Items, they will run into a difficulty because that would require five objects in a single report type. To overcome this limitation, the architect can either create two separate report types and join them in a joined report, or use an external reporting tool that can access data from multiple objects.

NEW QUESTION # 29

A casino is implementing Salesforce and is planning to build a customer 360 degree view for a customer who visits its resorts. The casino currently maintains the following systems that record customer activity:

1. Point-of-sale system: All purchases for a customer
2. Salesforce; All customer service activity and sales activities for a customer
3. Mobile app: All bookings, preferences, and browser activity for a customer
4. Marketing: All email, SMS, and social campaigns for a customer

Customer service agents using Salesforce would like to view the activities from all four systems to provide support to customers. The information has to be current and real time.

What strategy should the data architect implement to satisfy this requirement?

- A. Use a customer data mart to create the 360-degree view of the customer.
- B. Migrate customer activities from all four systems into Salesforce.
- C. Explore external data sources in Salesforce to build a 360-degree view of the customer.
- D. Periodically upload summary information in Salesforce to build a 360-degree view.

Answer: C

Explanation:

Exploring external data sources in Salesforce to build a 360 degree view of the customer (option A) is the best strategy to satisfy this requirement, as it allows customer service agents to view the activities from all four systems in real time without storing or replicating the data in Salesforce. Using a customer data mart to create the 360 degree view of the customer (option B) is not a good strategy, as it may introduce additional complexity and cost, and it does not leverage the native Salesforce features. Periodically uploading summary information in Salesforce to build a 360 degree view (option C) is also not a good strategy, as it may cause data latency and inconsistency, and it does not provide real-time information. Migrating customer activities from all four systems into Salesforce (option D) is also not a good strategy, as it may cause data redundancy and conflicts, and it does not scale well with large volumes of data.

NEW QUESTION # 30

Universal Containers (UC) is building a Service Cloud call center application and has a multisystem support solution. UC would like or ensure that all systems have access to the same customer information.

What solution should a data architect recommend?

- A. Let each system be an owner of data it generates.
- B. Load customer data in all systems.
- C. Implement a master data management (MDM) strategy for customer data.
- D. Make Salesforce the system of record for all data.

Answer: C

NEW QUESTION # 31

Universal Containers (UC) has 50 million customers and stores customer order history on an ERP system. UC also uses Salesforce to manage opportunities and customer support.

In order to provide seamless customer support, UC would like to see the customer's order history when viewing the customer record during a sales or support call.

What should a data architect do in order to provide this functionality, while preserving the user experience?

- A. Embed the ERP system in an iframe and display on a custom tab.
- B. Use Salesforce Connect and an external object to display the order history in Salesforce
- C. Use an Apex callout to populate a text area field for displaying the order history.
- D. Import the order history into a custom Salesforce object, update nightly

Answer: B

NEW QUESTION # 32

.....

Our Data-Architect practice materials will help you pass the Data-Architect exam with ease. The industry experts hired by Data-Architect study materials explain all the difficult-to-understand professional vocabularies by examples, diagrams, etc. All the languages used in Data-Architect real test were very simple and easy to understand. With our Data-Architect Study Materials, you don't have to worry about that you don't understand the content of professional books.
