## Free PDF InsuranceSuite-Analyst Best Study Material & Accurate Valid InsuranceSuite-Analyst Test Vce Ensure You a High Passing Rate

Our InsuranceSuite-Analyst study materials are compiled and verified by the first-rate experts in the industry domestically and they are linked closely with the real exam. Our products' contents cover the entire syllabus of the exam and refer to the past years' exam papers. Our test bank provides all the questions which may appear in the real exam and all the important information about the

exam. You can use the practice test software to test whether you have mastered the InsuranceSuite-Analyst Study Materials and the function of simulating the exam to be familiar with the real exam's pace, atmosphere and environment. So our InsuranceSuite-Analyst study materials are real-exam-based and convenient for the clients to prepare for the exam.

## **Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q29-Q34):**

### **NEW QUESTION # 29**

At the completion of Inception: (Select 2)

- A. Test cases are written to test end-to-end system functionality
- B. Documented acceptance criteria is tested to ensure the who, how, and why of story cards is defined
- C. A conceptual sprint plan is established to guide when user story cards will be built
- D. A confirmed scope and estimate is completed with associated user story cards

**Answer: C,D**

Explanation:

Comprehensive and Detailed Explanation (250-300 words):

The Inception phase in Guidewire SurePath is focused on planning, alignment, and validation, not execution. At the completion of Inception, two key outcomes are achieved: a confirmed scope and estimate and a conceptual sprint plan, making Options B and C correct.

A confirmed scope and estimate (Option B) ensures that stakeholders have a shared understanding of what will be delivered, supported by high-level user story cards. This reduces risk and sets realistic expectations before development begins.

A conceptual sprint plan (Option C) provides a roadmap for when stories are expected to be built. It does not assign tasks or commit teams to detailed schedules but offers directional guidance for delivery sequencing.

The remaining options are associated with later phases. Writing test cases (Option A) and validating acceptance criteria through testing (Option D) occur during development and testing iterations, not during Inception.

### **NEW QUESTION # 30**

In InsuranceSuite, Page Configuration Format (PCF) files control the user interface. Which of the following are examples of common widgets used in PCF files? (Choose two)

- A. MenuView
- B. DetailView
- C. Card
- D. NameValueView
- E. TextView

**Answer: B,D**

Explanation:

Why this is correct

\* NameValueView is a very common PCF widget used to display label-value pairs (for example, policy or claim attributes).

\* DetailView is another core PCF widget used to display detailed information for an entity in a structured layout.

Why the others are not selected

\* MenuView does exist in PCF, but when restricted to two choices, NameValueView and DetailView are the most fundamental and commonly referenced widgets in Guidewire training.

\* Card is not a Guidewire PCF widget.

\* TextView is not used as a standard standalone PCF widget in InsuranceSuite UI architecture.

### **NEW QUESTION # 31**

Why is it important for non-developers to have a basic understanding of the data model?

- A. It helps them complete product configuration
- B. It helps them know the underlying data when documenting change requests
- C. It helps them determine whether a field exists in the out-of-the-box product
- D. It is necessary for analysts writing configuration scripts

**Answer: B,C**

Explanation:

A basic understanding of the Guidewire data model is essential for non-developers, especially Business Analysts, to effectively document requirements and evaluate change requests. The correct answers are Options B and C.

Understanding the data model helps analysts determine whether a field already exists in the out-of-the-box product (Option B). This knowledge prevents unnecessary customization and supports Guidewire's configure-over-customize principle.

It also enables analysts to understand the underlying data structure when documenting change requests (Option C). Analysts who understand entities, relationships, and field types can write clearer requirements and anticipate downstream impacts.

Non-developers are not responsible for writing configuration scripts or completing product configuration, making Options A and D incorrect.

**NEW QUESTION # 32**

An example of a tool built by Guidewire Professional Services to support implementation projects is:

- A. Guiding principle
- B. Requirement
- C. User story card
- D. Business objective

**Answer: C**

Explanation:

The User Story Card is a key tool developed and standardized by Guidewire Professional Services to support InsuranceSuite implementation projects, making Option A the correct answer.

User story cards provide a structured, consistent way to capture requirements using an Agile approach aligned with SurePath methodology. They define business intent, acceptance criteria, and scope boundaries in a format that supports elaboration, estimation, development, and testing.

The remaining options are not tools. Requirements (Option B), business objectives (Option C), and guiding principles (Option D) are types of content, not standardized delivery tools.

User story cards enable consistent communication across analysts, developers, and testers and are central to successful Guidewire implementations.

**NEW QUESTION # 33**

A \_\_\_\_\_ key field stores a reference to a related object in another entity. It defines a unidirectional relationship. For example, AssignedUser in Claim is the name of a field that points to a specific user in the User entity.

- A. type
- B. array
- C. entity
- D. foreign
- E. field

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation:

In the Guidewire Data Model, a Foreign Key (Option C) is the mechanism used to link one entity to a specific instance of another entity.

\* Definition: A Foreign Key field stores the unique identifier (ID) of a related object in a different table.

This establishes a "Many-to-One" or "One-to-One" relationship. It is considered "unidirectional" because the link is defined on the source entity (the child) pointing to the target entity (the parent).

\* The Example: The question provides the example of AssignedUser on the Claim entity. A single claim is assigned to exactly one specific user. Therefore, the Claim entity contains a Foreign Key field named AssignedUser that holds the ID of the corresponding record in the User entity.

\* Analyst Relevance: Understanding Foreign Keys is crucial for Data Mapping. When an analyst defines requirements for integration, they must know if a field is a simple string or a link to another object. If it is a Foreign Key, the integration must provide the ID (or a public ID) of that existing object, not just a text name.

Why the other options are incorrect:

- \* B. Type key:A Type Key links to a TypeList(a static list of defined values like "Open," "Closed," or "Pending"), not to a dynamic "entity" that stores user data.
- \* E. Array:An Array defines a "One-to-Many" relationship (e.g., a Policy has an array of Vehicles), which is the inverse of a Foreign Key.
- \* D. Field:While technically a field, the specific architectural term for a reference field is a Foreign Key. "Field" generally implies atomic data (String, Integer).
