#### NEW QUESTION # 431

Which of the following are aspects of cloud data availability? (Choose two.)

- **A. Geo-redundancy**
- **B. Zones**
- C. Resource tagging
- D. Auto-scaling
- E. Locality
- F. Data sovereignty

**Answer: A,B**

Explanation:

Cloud data availability is the process of ensuring that data is accessible to end users and applications, when and where they need it. It defines the degree or extent to which data is readily usable along with the necessary IT and management procedures, tools and technologies required to enable, manage and continue to make data available<sup>1</sup>. Cloud data availability is influenced by several aspects, such as:

**Zones:** Zones are logical or physical partitions of a cloud region that have independent power, cooling, and networking infrastructure. They are designed to isolate failures within a region and provide high availability and fault tolerance for cloud services and data. For example, Google Cloud<sup>2</sup> and Azure<sup>3</sup> offer availability zones that allow users to distribute their resources and data across multiple zones within a region, ensuring that if one zone experiences an outage, the other zones can continue to function and serve the data.

**Geo-redundancy:** Geo-redundancy is the practice of replicating or storing data across multiple geographic locations or regions. It is intended to improve data availability and durability by protecting data from regional disasters, network failures, or malicious attacks. For example, Google Cloud<sup>2</sup> and Azure<sup>3</sup> offer geo-redundant storage options that allow users to store their data in two or more regions, ensuring that if one region becomes unavailable, the data can be accessed from another region.

**Resource tagging** is the practice of assigning metadata or labels to cloud resources, such as instances, volumes, or buckets. It is used to organize, manage, and monitor cloud resources and data, but it does not directly affect data availability.

**Data sovereignty** is the concept that data is subject to the laws and regulations of the country or region where it is stored or processed. It is a legal and compliance issue that affects data security, privacy, and governance, but it does not directly affect data availability.

**Locality** is the concept that data is stored or processed close to the source or destination of the data. It is used to optimize data performance, latency, and bandwidth, but it does not directly affect data availability.

**Auto-scaling** is the practice of automatically adjusting the amount or type of cloud resources, such as instances, nodes, or pods, based on the demand or load of the data. It is used to optimize data efficiency, scalability, and reliability, but it does not directly affect data availability. Reference:
