### Veeam Certified Engineer v12 Sample Questions (Q109-Q114):

#### NEW QUESTION # 109

What describes an RPO?

- A. To determine the maximum length of time a workload or application can be down
- B. To confirm the data loss tolerance of a Business Unit or Organization**
- C. To clarify how many restore points need to be recovered at the same time
- D. To confirm at what point a backup should be migrated to Object Storage

**Answer: B**

Explanation:

Recovery Point Objective (RPO) refers to the maximum acceptable amount of data loss measured in time. It is essentially the age of the files that must be recovered from backup storage for normal operations to resume after a failure or disaster. In other words, it defines the data loss tolerance of a business unit or organization. If an RPO is set to one hour, the system must back up at least every hour to meet the RPO. References:

#### NEW QUESTION # 110

Why is It recommended to have at least one backup proxy server in each site when defining a replica Job?

- A. The proxies allow automatic WAN acceleration.
- B. The proxies allow for no VM snapshots during transit.
- C. The proxies enable a stable connection for VM data transfer across sites.**
- D. The proxies allow replication automatic restart after failure.

**Answer: C**

Explanation:

Explanation

A backup proxy is a component that acts as a data mover in the backup infrastructure. It retrieves data from the source and transfers it to the target<sup>1</sup>. When defining a replica job, it is recommended to have at least one backup proxy server in each site to enable a stable connection for VM data transfer across sites<sup>2</sup>. This way, the backup proxy at the source site can communicate with

the backup proxy at the target site and send data over the WAN without affecting the production hosts<sup>2</sup>. The other options are not correct for explaining why backup proxies are recommended. The proxies do not allow automatic WAN acceleration, as this is a function of the WAN accelerators<sup>3</sup>. The proxies do not allow for no VM snapshots during transit, as the replication process requires creating a snapshot of the source VM to read its data. The proxies do not allow replication automatic restart after failure, as this is a setting of the replication job.

#### NEW QUESTION # 112

In the war against ransomware, a company decided to implement tape backup. The infrastructure contains Hyper-V VMs. What is the correct approach to getting all servers onto tape?

- A. Create media sets, then create file to tape jobs.
- B. Create media sets, then create backup to tape jobs.
- C. Create media pools, then create file to tape jobs.
- D. Create media pools, then create backup to tape jobs.

**Answer: D**

Explanation:

The correct approach for backing up Hyper-V VMs to tape in a ransomware protection strategy is to create media pools first and then configure backup to tape jobs. This method ensures organized and efficient tape management while securing VM backups on tape media.

#### NEW QUESTION # 113

Which backup method will always produce a full backup as the most recent restore point?

- A. Reverse incremental backup
- B. Forward incremental backup
- C. Forever forward incremental backup
- D. Forward incremental with transform

**Answer: A**
