## Huawei HCIP-Access V2.5 Sample Questions (Q39-Q44):

### NEW QUESTION # 39

(Single choice) The following statement about the PITP protocol is incorrect

- A. The purpose of the PITP feature is to provide the upper authentication server with the physical location information of the access user, and the BRAS device can realize the user account and the press position after obtaining the user access location information
- B. The PITP protocol includes PITP P mode and PITP V mode
- C. In PITP V mode, the user's physical location information is added to the PPPoE message sent by the user side to cooperate with the upper-level server for user authentication
- **D. Bind the authentication of the information to avoid the theft and roaming of the user account**
- E. PITP P mode can also be called PPPoE+ mode

**Answer: D**

Explanation:

PITP (Port Identification Transparent Transmission) is used on access networks to carry a user's physical access-location to the upper AAA/BRAS. It has two working forms: P-mode (PPPoE+)-injecting location identifiers into PPPoE discovery-and V-mode (Vendor-tag)-carrying vendor/location tags transparently upstream. The purpose is to let the upper server associate user credentials with access location and, by policy, restrict roaming. Options A, B, D, and E correctly describe these behaviors/terms. Option C is inaccurate as written: PITP itself does not "bind the authentication" or inherently "avoid theft/roaming"; it only delivers location info. Preventing credential theft/roaming is achieved by AAA/BRAS policy that uses the PITP- carried location, not by PITP alone.

### NEW QUESTION # 40

The ascending wavelength of the (radio) 10G EPONE is?

- A. 1577nm
- **B. 1270m (symmetrical).**
- C. 1490nm
- **D. 1310m (asymmetrical).**

**Answer: B,D**

### NEW QUESTION # 41

In Layer 2 multicast, how many multicast IP addresses can a multicast MAC address correspond to?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

For IPv4 multicast, the MAC mapping uses 01-00-5E followed by the low-order 23 bits of the multicast IP address. Because an IPv4 multicast address has 28 variable bits (224/4), 5 bits are not mapped to the MAC.

Therefore,  $2^5 = 32$  distinct multicast IP addresses can map to the same multicast MAC address.

#### NEW QUESTION # 42

(Radio) When configuring multicast services on MA5600T/MA5680T, the programs of multicast VLANs are statically configured. Which of the following must be configured, otherwise the multicast programs may not be able to be watched?

- A. igmp program
- B. igmp profile
- C. igmp preview
- D. igmp priority

**Answer: A**

Explanation:

On Huawei OLTs (e.g., MA5600T/MA5680T), deploying IPTV/multicast commonly uses a program list (channel list) to map program numbers to multicast group addresses-this is configured with igmp program.

When programs are statically configured under the multicast VLAN, the program definitions themselves are mandatory; without them, set-top boxes cannot select (zap to) channels by program number/address mapping and the OLT cannot correctly forward the requested multicast streams.

#### NEW QUESTION # 43

Which of the following statements about terminal selection principles are correct?

- A. Cost needs to be considered.
- B. Project requirements do not need to be considered.
- C. Terminal types should be selected based on the network construction mode.
- D. Special requirements must be considered.

**Answer: A,C,D**

Explanation:

Terminal (ONT/ONU/CPE) selection adheres to engineering principles: align model and interfaces with the deployment mode and scenario, evaluate TCO/cost, and satisfy special requirements (such as PoE, Wi-Fi specs, voice/FXS, industrial temperature). Ignoring project requirements is contrary to standard design workflows; therefore D is not correct.
