CompTIA Server+ Certification Exam Sample Questions (Q19-Q24):

NEW QUESTION # 19
A server administrator created a new script and included the path to the script binary as the first line of the script. Which of the following scripting languages did the administrator most likely use?

- A. Java
- B. Bash
- C. Batch
- D. PowerShell

Answer: B

Explanation:
In Bash (a Unix/Linux shell scripting language), it is common to include the shebang (#!) followed by the path to the interpreter (e.g., #!/bin/bash) on the first line of the script. This tells the operating system which interpreter to use to execute the script.
* Bash (Answer C): Bash scripts often start with a shebang line that specifies the path to the binary (#!
/bin/bash).
* Batch (Option A): Batch scripts (used in Windows) do not require a path to the interpreter on the first line.
* Java (Option B): Java is a compiled language, not a scripting language, so this does not apply.
* PowerShell (Option D): PowerShell scripts (.ps1 files) do not typically require specifying the interpreter path on the first line.
CompTIA Server+ Reference:This topic is related to SK0-005 Objective 1.1: Understand scripting basics and the use of interpreters.

NEW QUESTION # 20
A technician is attempting to log in to a Linux server as root but cannot remember the administrator password. Which of the following is the LEAST destructive method of resetting the administrator password?

- A. Boot using a Linux live CD and mount the hard disk to /mnt. Change to the /mnt/etc directory. Edit the passwd file found in that directory.
- B. Reinstall the OS in overlay mode. Reset the root password from the install GUI screen.
- C. Adjust the GRUB boot parameters to boot into single-user mode. Run passwd from the command prompt.
- D. Boot using a Linux live CD and mount the hard disk to /mnt. SCP the /etc directory from a known accessible server to /mnt/etc.

Answer: C

Explanation:
This is the least destructive method of resetting the administrator password because it does not require modifying any files or reinstalling the OS. It only requires changing the boot parameters temporarily and running a command to change the password.

NEW QUESTION # 21
A technician set up a new multifunction printer. After adding the printer to the print server, the technician configured the printer on each user's machine. Several days later, users reported that they were no longer able to print, but scanning to email worked. Which of the following is most likely causing this issue?

- A. The network firewall was enabled.

- B. The printer's network interface failed.
- C. The gateway is no longer being reached.
- D. The printer had DHCP enabled.

Answer: D

Explanation:
The most likely cause of this issue is that the printer had DHCP enabled, which changed its IP address after adding it to the print server and configuring it on each user's machine. DHCP (Dynamic Host Configuration Protocol) is a network protocol that assigns IP addresses and other network configuration parameters to devices automatically, without manual intervention. DHCP can simplify network management and avoid IP conflicts, but it can also cause problems if the devices are not configured to use static or reserved IP addresses.
If the printer had DHCP enabled, it might have received a different IP address from the DHCP server after rebooting or reconnecting to the network, which would make it unreachable by the print server and the users' machines that were configured with the previous IP address. Scanning to email would still work, as it does not depend on the print server or the users' machines, but on the printer's SMTP settings and internet connection. NEW QUESTION # 22
A backup application is copying only changed files each line it runs. During a restore, however, only a single file is used. Which of the following backup methods does this describe?

- A. Open file
- B. Full Incremental
- C. Full differential
- D. Synthetic full

Answer: D

Explanation:
Explanation
A synthetic full backup is a backup method that describes copying only changed files each time it runs and using only a single file during a restore. A synthetic full backup is a backup approach that involves creating a new full backup by using the previous full backup and related incremental backups. This means that a backup solution does not have to transfer the full amount of data from the source machine and can synthetize the latest incremental backups with the last full backup to create a new full backup. This reduces the backup window and network bandwidth consumption. During a restore, only the latest synthetic full backup file is needed to recover the data. Open file backup is a backup method that allows backing up files that are in use or locked by applications. Full incremental backup is a backup method that involves performing a full backup first and then backing up only the changed files since the last backup. Full differential backup is a backup method that involves performing a full backup first and then backing up only the changed files since the last full backup.

NEW QUESTION # 23
A systems administrator notices a newly added server cannot see any of the LUNs on the SAN. The SAN switch and the local HBA do not display any link lights. Which of the following is most likely the issue?

- A. The HBA driver needs to be installed on the server.
- B. The zoning on the fiber switch is wrong.
- C. A single-mode fiber cable is used in place of multimode.
- D. The switchport is on the wrong virtual SAN.

Answer: C

Explanation:
The most likely issue that prevents the newly added server from seeing any of the LUNs on the SAN is that a single-mode fiber cable is used in place of multimode. A single-mode fiber cable is a type of optical fiber cable that has a small core diameter and allows only one mode of light to propagate through it. A single-mode fiber cable can transmit data over long distances at high speeds, but it requires more expensive transceivers and connectors than multimode fiber cables. A multimode fiber cable is a type of

optical fiber cable that has a larger core diameter and allows multiple modes of light to propagate through it. A multimode fiber cable can transmit data over short distances at lower speeds than single-mode fiber cables, but it is more compatible and cost-effective than single-mode fiber cables. If a single-mode fiber cable is used in place of multimode, it can cause signal loss, attenuation, or mismatch between the devices.
