Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q318-Q323):

NEW QUESTION # 318

A company is launching a new application deployed on an Amazon Elastic Container Service (Amazon ECS) cluster and is using the Fargate launch type for ECS tasks. The company is monitoring CPU and memory usage because it is expecting high traffic to the application upon its launch. However, the company wants to reduce costs when utilization decreases.

What should a solutions architect recommend?

- A. Use AWS Application Auto Scaling with target tracking policies to scale when ECS metric breaches trigger an Amazon CloudWatch alarm.
- B. Use Amazon EC2 Auto Scaling with simple scaling policies to scale when ECS metric breaches trigger an Amazon CloudWatch alarm.
- C. Use an AWS Lambda function to scale Amazon ECS based on metric breaches that trigger an Amazon CloudWatch alarm.
- D. Use Amazon EC2 Auto Scaling to scale at certain periods based on previous traffic patterns.

Answer: A

NEW QUESTION # 319

How can an EBS volume that is currently attached to an EC2 instance be migrated from one Availability Zone to another?

- **A. Create a snapshot of the volume, and create a new volume from the snapshot in the other AZ**
- B. Detach the volume, then use the ec2-migrate-volume command to move it to another AZ
- C. Simply create a new volume in the other AZ and specify the original volume as the source
- D. Detach the volume and attach it to another EC2 instance in the other AZ

Answer: A

NEW QUESTION # 320

At part of budget planning, management wants a report of AWS billed items listed by user. The data will be used to create department budgets. A solution architect needs to determine the most efficient way to obtain this report information. Which solution meets these requirements?

- **A. Create a report in Cost Explorer and download the report**
- B. Access the bill details from the billing dashboard and download via bill.
- C. Run a query with Amazon Athena to generate the report.
- D. Modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES).

Answer: A

Explanation:

This option is the most efficient because it uses Cost Explorer, which is a tool that allows you to visualize, understand, and manage your AWS costs and usage over time¹. You can create a report in Cost Explorer that lists AWS billed items by user, using the user name tag as a filter². You can then download the report as a CSV file and use it for budget planning. Option A is less efficient because it uses Amazon Athena, which is a serverless interactive query service that allows you to analyze data in Amazon S3 using standard SQL³. You would need to set up an Athena table that points to your AWS Cost and Usage Report data in S3, and then run a query to generate the report. This would incur additional costs and complexity. Option C is less efficient because it uses the billing dashboard, which provides a high-level summary of your AWS costs and usage.

You can access the bill details from the billing dashboard and download them via bill, but this would not list the billed items by user. You would need to use tags to group your costs by user name, which would require additional steps. Option D is less efficient because it uses AWS Budgets, which is a tool that allows you to plan your service usage, service costs, and instance reservations. You can modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES), but this would not generate a report of AWS billed items by user. This would only notify you when your actual or forecasted costs exceed or are expected to exceed your budgeted amount.

NEW QUESTION # 321

A company's data platform uses an Amazon Aurora MySQL database. The database has multiple read replicas and multiple DB instances across different Availability Zones. Users have recently reported errors from the database that indicate that there are too many connections. The company wants to reduce the failover time by 20% when a read replica is promoted to primary writer.

Which solution will meet this requirement?

- A. Switch from Aurora to Amazon RDS with Multi-AZ cluster deployment.
- B. Switch to Amazon DynamoDB with DynamoDB Accelerator (DAX) for read connections.
- C. Switch to Amazon Redshift with relocation capability.
- **D. Use Amazon RDS Proxy in front of the Aurora database.**

Answer: D

Explanation:

Amazon RDS Proxy is a service that provides a fully managed, highly available database proxy for Amazon RDS and Aurora databases. It allows you to pool and share database connections, reduce database load, and improve application scalability and availability.

By using Amazon RDS Proxy in front of your Aurora database, you can achieve the following benefits:

You can reduce the number of connections to your database and avoid errors that indicate that there are too many connections. Amazon RDS Proxy handles the connection management and multiplexing for you, so you can use fewer database connections and resources.

You can reduce the failover time by 20% when a read replica is promoted to primary writer. Amazon RDS Proxy automatically detects failures and routes traffic to the new primary instance without requiring changes to your application code or configuration. According to a benchmark test, using Amazon RDS Proxy reduced the failover time from 66 seconds to 53 seconds, which is a 20% improvement.

You can improve the security and compliance of your database access. Amazon RDS Proxy integrates with AWS Secrets Manager and AWS Identity and Access Management (IAM) to enable secure and granular authentication and authorization for your database connections.

NEW QUESTION # 322

Within a VPC, you need to allow a wide range of ports, and block several non-contiguous ports within the range. Which option will allow you to do this ?

- A. Using a network ACL, place a DENY rule for ports to be blocked after the ALLOW rule for the wide range of ports
- B. Using a security group, place a DENY rule for ports to be blocked ahead of the ALLOW rule for the wide range of ports
- C. Using a security group, place a DENY rule for ports to be blocked after the ALLOW rule for the wide range of ports
- D. Using a network ACL, place a DENY rule for ports to be blocked ahead of the ALLOW rule for the wide range of ports

Answer: A
