- A. Bucket quota: After the capacity for written data of a bucket is used up, no more data can be written to the bucket.
- B. Tenant quota: After the capacity for written data of a tenant is used up, no more data can be written by the tenant.
- C. An alarm or event is triggered when the number of resources reaches the limit.
- D. A quota is a method of controlling resource access.

Answer: A,B,C,D

Explanation:

In Huawei's object storage management (OceanStor Pacific), quotas are a critical administrative tool for resource governance.

Option C is correct as quotas serve as a fundamental method for controlling how much of the physical resource pool a specific entity (tenant or user) can access and consume.

Option A and D are correct because Huawei supports both Tenant-level and Bucket-level quotas. Once a Hard Quota limit is

reached for a tenant or a specific bucket, the storage system will reject further write requests (PUT operations) to prevent exceeding the allocated budget. Option B is correct because the storage management system (DeviceManager or eSight) integrates with the quota system to trigger alarms when usage reaches predefined thresholds (such as 80% or 90%) or when the resource limit is reached, allowing administrators to take proactive measures like expanding the quota or cleaning up data.
