授權的新版Terraform-Associate-003題庫上線 | 第一次嘗試和最新HashiCorp HashiCorp Certified: Terraform Associate (003) (HCTA0-003)輕鬆學習和通過考試

選擇了VCESoft提供的最新最準確的關於HashiCorp Terraform-Associate-003考試產品，屬於你的成功就在不遠處。

HashiCorp Terraform-Associate-003 考試大綱：

主題	簡介
主題 1	<ul style="list-style-type: none">Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.
主題 2	<ul style="list-style-type: none">Develop and troubleshoot dynamic configuration: This section deals with topics such as using language features to validate configuration query providers using data sources, computing and interpolating data using HCL functions, and using meta-arguments in configuration.
主題 3	<ul style="list-style-type: none">Create, maintain, and use Terraform modules: In this section of the exam, candidates are tested for creating a module, using a module in configuration, and topics such as refactoring an existing configuration into modules.

主題 4	<ul style="list-style-type: none">• Configure and use Terraform providers: In this section, topics covered include understanding Terraform's plugin-based architecture and configuring providers. It also covers aliasing, sourcing, and versioning functions.

問題 #93

Which provider authentication method prevents credentials from being stored in the state file?

- A. Setting credentials as Terraform variables
- B. Specifying the login credentials in the provider block
- C. None of the above
- D. Using environment variables

答案: C

解題說明:

Explanation

None of the above methods prevent credentials from being stored in the state file. Terraform stores the provider configuration in the state file, which may include sensitive information such as credentials. This is a potential security risk and should be avoided if possible. To prevent credentials from being stored in the state file, you can use one of the following methods:

Use environment variables to pass credentials to the provider. This way, the credentials are not part of the provider configuration and are not stored in the state file. However, this method may not work for some providers that require credentials to be set in the provider block.

Use dynamic credentials to authenticate with your cloud provider. This way, Terraform Cloud or Enterprise will request temporary credentials from your cloud provider for each run and use them to provision your resources. The credentials are not stored in the state file and are revoked after the run is completed. This method is supported for AWS, Google Cloud Platform, Azure, and Vault.

問題 #94

How could you reference an attribute from the vsphere_datacenter data source for use with the datacenter_id argument within the vsphere_folder resource in the following configuration?

- A. Data,dc,id
- B. Data.vsphere_datacenter.DC.id
- C. Vsphere_datacenter.dc.id
- D. Data.vsphere_datacenter,dc

答案: B

解題說明:

The correct way to reference an attribute from the vsphere_datacenter data source for use with the datacenter_id argument within the vsphere_folder resource in the following configuration is data.vsphere_datacenter.dc.id. This follows the syntax for accessing data source attributes, which is data.TYPE.NAME.ATTRIBUTE. In this case, the data source type is vsphere_datacenter, the data source name is dc, and the attribute we want to access is id. The other options are incorrect because they either use the wrong syntax, the wrong punctuation, or the wrong case. Reference = [Data Source: vsphere_datacenter], [Data Source: vsphere_folder], [Expressions: Data Source Reference]

問題 #95

How is terraform inport run?

- A. As a part of terraform refresh
- B. By an explicit call
- C. As a part of terraform init
- D. All of the above

- E. As a part of terraform plan

答案： B

解題說明：

The terraform import command is not part of any other Terraform workflow. It must be explicitly invoked by the user with the appropriate arguments, such as the resource address and the ID of the existing infrastructure to import.

References = [Importing Infrastructure]

問題 #96

Which Terraform collection type should you use to store key/value pairs?

- A. Set
- B. Map
- C. Tuple
- D. list

答案： B

解題說明：

The Terraform collection type that should be used to store key/value pairs is map. A map is a collection of values that are accessed by arbitrary labels, called keys. The keys and values can be of any type, but the keys must be unique within a map. For example, var = { key1 = "value1", key2 = "value2" } is a map with two key/value pairs. Maps are useful for grouping related values together, such as configuration options or metadata. Reference = [Collection Types], [Map Type Constraints]

問題 #97

Which command doesnotcause Terraform to refresh its state?

- A. terraform state list
- B. terraform plan
- C. terraform apply
- D. terraform destroy

答案： A

解題說明：

* terraform state list only displays resources stored in the state file but does not interact with the cloud provider or refresh the state.

* terraform plan, terraform apply, and terraform destroy compare or modify the infrastructure, so they refresh the state to ensure accuracy.
