## **Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q513-Q518):**

### **NEW QUESTION # 513**

A company has an organization in AWS Organizations that has all features enabled The company requires that all API calls and logins in any existing or new AWS account must be audited The company needs a managed solution to prevent additional work and to minimize costs The company also needs to know when any AWS account is not compliant with the AWS Foundational Security Best Practices (FSBP) standard.

Which solution will meet these requirements with the LEAST operational overhead?

- **A. Deploy an AWS Control Tower environment in a dedicated Organizations member account Enable AWS Security Hub and AWS Control Tower Account Factory in the environment.**
- B. Use AWS Managed Services (AMS) Accelerate to build a multi-account landing zone (MALZ) Submit an RFC to self-service provision AWS Security Hub in the MALZ.
- C. Use AWS Managed Services (AMS) Accelerate to build a multi-account landing zone (MALZ) Submit an RFC to self-service provision Amazon GuardDuty in the MALZ.
- D. Deploy an AWS Control Tower environment in the Organizations management account Enable AWS Security Hub and AWS Control Tower Account Factory in the environment.

**Answer: A**

Explanation:

AWS Control Tower is a fully managed service that simplifies the setup and governance of a secure, compliant, multi-account AWS environment. It establishes a landing zone that is based on best-practices blueprints, and it enables governance using controls you can choose from a pre-packaged list. The landing zone is a well-architected, multi-account baseline that follows AWS best practices. Controls implement governance rules for security, compliance, and operations. AWS Security Hub is a service that provides a comprehensive view of your security posture across your AWS accounts. It aggregates, organizes, and prioritizes security alerts and findings from multiple AWS services, such as Amazon GuardDuty, Amazon Inspector, Amazon Macie, AWS Firewall Manager, and AWS IAM Access Analyzer, as well as from AWS Partner solutions. AWS Security Hub continuously monitors your environment using automated compliance checks based on the AWS best practices and industry standards, such as the AWS Foundational Security Best Practices (FSBP) standard. AWS Control Tower Account Factory is a feature that automates the provisioning of new AWS accounts that are preconfigured to meet your business, security, and compliance requirements.

By deploying an AWS Control Tower environment in the Organizations management account, you can leverage the existing organization structure and policies, and enable AWS Security Hub and AWS Control Tower Account Factory in the environment. This way, you can audit all API calls and logins in any existing or new AWS account, monitor the compliance status of each account with the FSBP standard, and provision new accounts with ease and consistency. This solution meets the requirements with the least operational overhead, as you do not need to manage any infrastructure, perform any data migration, or submit any requests for changes.

#### NEW QUESTION # 514

You have set up an Auto Scaling group. The cool down period for the Auto Scaling group is 7 minutes.

The first instance is launched after 3 minutes, while the second instance is launched after 4 minutes. How many minutes after the first instance is launched will Auto Scaling accept another scaling activity request?

- A. 7 minutes
- B. 14 minutes
- C. 10 minutes
- D. 11 minutes

**Answer: D**

Explanation:

If an Auto Scaling group is launching more than one instance, the cool down period for each instance starts after that instance is launched. The group remains locked until the last instance that was launched has completed its cool down period. In this case the cool down period for the first instance starts after 3 minutes and finishes at the 10th minute (3+7 cool down), while for the second instance it starts at the 4th minute and finishes at the 11th minute (4+7 cool down). Thus, the Auto Scaling group will receive another request only after 11 minutes.

#### NEW QUESTION # 515

A company is building a critical ingestion service on AWS that will receive 1,000 incoming events per second.

The events must be processed in order, and no events may be

lost. Multiple applications will need to process each event. The company will expose the service as RESTful calls through an API Gateway.

What should a Solutions Architect use to receive the events based on these requirements?

- A. Amazon SNS
- B. Amazon SQS
- C. Amazon Kinesis Data Stream
- D. Amazon DynamoDB

**Answer: C**

Explanation:

Explanation

Q: How does Amazon Kinesis Data Streams differ from Amazon SQS? Amazon Kinesis Data Streams enables real-time processing of streaming big data. It provides ordering of records, as well as the ability to read and/or replay records in the same order to multiple Amazon Kinesis Applications. The Amazon Kinesis Client Library (KCL) delivers all records for a given partition key to the same record processor, making it easier to build multiple applications reading from the same Amazon Kinesis data stream (for example, to perform counting, aggregation, and filtering). Amazon Simple Queue Service (Amazon SQS) offers a reliable, highly scalable hosted queue for storing messages as they travel between computers. Amazon SQS lets you easily move data between distributed application components and helps you build applications in which messages are processed independently (with message-level ack/fail semantics), such as automated workflows.

#### NEW QUESTION # 516

A solutions architect plans to convert a company's monolithic web application into a multi-tier application. The company wants to avoid managing its own infrastructure. The minimum requirements for the web application are high availability, scalability, and regional low latency during peak hours. The solution should also store and retrieve data with millisecond latency using the application's API. Which solution meets these requirements?

- A. Use an Amazon CloudFront distribution that points to an Elastic Load Balancer with an Amazon EC2 Auto Scaling group, along with Amazon RDS Multi-AZ DB instances
- B. Use an Amazon Route 53 routing policy with geolocation that points to an Amazon S3 bucket with static website hosting and Amazon DynamoDB as the data store
- **C. Use Amazon API Gateway with an edge-optimized API endpoint. AWS Lambda for compute, and Amazon DynamoDB as the data store**
- D. Use AWS Fargate to host the web application with backend Amazon RDS Multi-AZ DB instances

**Answer: C**

#### NEW QUESTION # 517

You have set up an S3 bucket with a number of images in it and you have decided that you want anybody to be able to access these images, even anonymous users. To accomplish this you create a bucket policy.

You will need to use an Amazon S3 bucket policy that specifies a \_\_\_\_\_ in the principal element, which means anyone can access the bucket.

- A. S3 user
- B. anonymous user
- **C. wildcard (\*)**
- D. hash tag (#)

**Answer: C**

Explanation:

You can use the AWS Policy Generator to create a bucket policy for your Amazon S3 bucket. You can then use the generated document to set your bucket policy by using the Amazon S3 console, by a number of third-party tools, or via your application. You use an Amazon S3 bucket policy that specifies a wildcard (\*) in the principal element, which means anyone can access the bucket. With anonymous access, anyone (including users without an AWS account) will be able to access the bucket.
