NEW QUESTION # 317

Your network contains an on-premises Active Directory domain named contoso.com. The domain contains the objects shown in the following table.

Name	Configuration
Group1	Global security group
User1	Enabled user account
User2	Disabled user account

You configure Azure AD Connect to sync contoso.com to Azure AD.

Which objects will sync to Azure AD?

- A. User1 and User2 only
- B. Group1 only
- C. Group1 and User1 only
- D. Group1, User1, and User2

Answer: D

Explanation:

Disabled accounts

Disabled accounts are synchronized as well to Azure AD. Disabled accounts are common to represent resources in Exchange, for example conference rooms. The exception is users with a linked mailbox; as previously mentioned, these will never provision an account to Azure AD.

The assumption is that if a disabled user account is found, then we won't find another active account later and the object is provisioned to Azure AD with the userPrincipalName and sourceAnchor found. In case another active account will join to the same metaverse object, then its userPrincipalName and sourceAnchor will be used.
