2026 Accurate Valid SPLK-2002 Exam Pass4sure | 100% Free SPLK-2002 Valid Dumps Questions

It is carefully edited and reviewed by our experts. The design of the content conforms to the examination outline. Through the practice of our SPLK-2002 study materials, you can grasp the intention of the examination organization accurately. The number of its test questions is several times of the traditional problem set, which basically covers all the knowledge points to be mastered in the exam. You only need to review according to the content of our SPLK-2002 Study Materials, no need to refer to other materials. With the help of our SPLK-2002 study materials, your preparation process will be relaxed and pleasant.

Splunk Enterprise Certified Architect Sample Questions (Q111-Q116):

NEW QUESTION # 111

Which command should be run to re-sync a stale KV Store member in a search head cluster?

- A. splunk resync kvstore -local
- B. splunk clean kvstore -local
- C. splunk resync kvstore -remote
- D. splunk clean eventdata -local

Answer: B

Explanation:

* To resync a stale KV Store member in a search head cluster, you need to stop the search head that has the stale KV Store member, run the command `splunk clean kvstore --local`, and then restart the search head. This triggers the initial synchronization from other KV Store members¹2.

* The command `splunk resync kvstore [-source sourceId]` is used to resync the entire KV Store cluster from one of the members, not a single member. This command can only be invoked from the node that is operating as search head cluster captain².

* The command `splunk clean eventdata -local` is used to delete all indexed data from a standalone indexer or a cluster peer node, not to resync the KV Store³.

* References:

* 2: Resync the KV store - Splunk Documentation

* 3: Delete indexed data - Splunk Documentation

NEW QUESTION # 112

Which of the following statements describe search head clustering? (Select all that apply.)

- A. The deployer must have sufficient CPU and network resources to process service requests and push configurations.
- B. Search heads must meet the high-performance reference server requirements.
- C. A deployer is required.
- D. At least three search heads are needed.

Answer: A,C,D

Explanation:

Search head clustering is a Splunk feature that allows a group of search heads to share configurations, apps, and knowledge objects, and to provide high availability and scalability for searching. Search head clustering has the following characteristics:

* A deployer is required. A deployer is a Splunk instance that distributes the configurations and apps to the members of the search head cluster. The deployer is not a member of the cluster, but a separate instance that communicates with the cluster master.

* At least three search heads are needed. A search head cluster must have at least three search heads to form a quorum and to ensure high availability. If the cluster has less than three search heads, it cannot function properly and will enter a degraded mode.

* The deployer must have sufficient CPU and network resources to process service requests and push configurations. The deployer is responsible for handling the requests from the cluster master and the cluster members, and for pushing the configurations and apps to the cluster members. Therefore, the deployer must have enough CPU and network resources to perform these tasks efficiently and reliably.

Search heads do not need to meet the high-performance reference server requirements, as this is not a mandatory condition for search head clustering. The high-performance reference server requirements are only recommended for optimal performance and scalability of Splunk deployments, but they are not enforced by Splunk.

NEW QUESTION # 113

Which Splunk Enterprise offering has its own license?

- A. Splunk Heavy Forwarder
- B. Splunk Cloud Forwarder
- C. Splunk Universal Forwarder
- D. Splunk Forwarder Management

Answer: C

Explanation:

Explanation

The Splunk Universal Forwarder is the only Splunk Enterprise offering that has its own license. The Splunk Universal Forwarder license allows the forwarder to send data to any Splunk Enterprise or Splunk Cloud instance without consuming any license quota. The Splunk Heavy Forwarder does not have its own license, but rather consumes the license quota of the Splunk Enterprise or Splunk Cloud instance that it sends data to.

The Splunk Cloud Forwarder and the Splunk Forwarder Management are not separate Splunk Enterprise offerings, but rather features of the Splunk Cloud service. For more information, see [About forwarder licensing] in the Splunk documentation.

NEW QUESTION # 114

Splunk configuration parameter settings can differ between multiple .conf files of the same name contained within different apps. Which of the following directories has the highest precedence?

- A. App default directories, in ASCII order.
- **B. System local directory.**
- C. App local directories, in ASCII order.
- D. System default directory.

Answer: B

Explanation:

The system local directory has the highest precedence among the following directories that contain Splunk configuration files of the same name within different apps. Splunk configuration files are stored in various directories under the SPLUNK_HOME/etc directory. The precedence of these directories determines which configuration file settings take effect when there are conflicts or overlaps. The system local directory, which is located at SPLUNK_HOME/etc/system/local, has the highest precedence among all directories, because it contains the system-level configurations that are specific to the instance. The system default directory, which is located at SPLUNK_HOME/etc/system/default, has the lowest precedence among all directories, because it contains the system-level configurations that are provided by Splunk and should not be modified. The app local directories, which are located at SPLUNK_HOME/etc/apps/APP_NAME/local, have a higher precedence than the app default directories, which are located at SPLUNK_HOME/etc/apps/APP_NAME/default, because the local directories contain the app-level configurations that are specific to the instance, while the default directories contain the app-level configurations that are provided by the app and should not be modified. The app local and default directories have different precedences depending on the ASCII order of the app names, with the app names that come later in the ASCII order having higher precedences.

NEW QUESTION # 115

(Which Splunk component allows viewing of the LISPY to assist in debugging Splunk searches?)

- A. Search Job Inspector
- B. dbinspect
- **C. walklex**
- D. Monitoring Console

Answer: C

Explanation:

The walklex command in Splunk is a specialized administrative search command used to translate and display LISPY (Splunk's internal representation of search terms). LISPY is the logical search syntax Splunk uses to parse and execute search queries, and examining it helps administrators and developers debug search optimization, field extraction behavior, and index-time search efficiency.

When you run the command `| walklex search="your_search_string"`, Splunk outputs how it tokenizes and interprets that query internally. This is particularly useful for understanding how Splunk's search language maps to index-time fields and for diagnosing performance issues caused by inefficient search term parsing.

For example:

```
| walklex search="error OR failure host=server01"
```

Displays the corresponding LISPY translation used by Splunk's search subsystem.

Other options are unrelated:

- * dbinspect provides index bucket metadata.
- * Monitoring Console shows performance metrics and health status.
- * Search Job Inspector analyzes search execution phases but doesn't expose LISPY.

Thus, the correct and Splunk-documented tool for LISPY inspection is the walklex command.

References (Splunk Enterprise Documentation):

- * walklex Command Reference - LISPY and Search Debugging
