The web-based Pure Storage Portworx-Enterprise-Professional Practice Exam is compatible with all operating systems, including Mac, Linux, iOS, Android, and Windows. It is a browser-based Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) practice exam that works on all major browsers, including Chrome, Firefox, Safari, Internet Explorer, and Opera. This means that you won't have to worry about installing any complicated software or plug-ins.

Nowadays most people are attracted to the Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) certification and take it seriously because they know that it is the future. But they can't figure out where to prepare for Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) certification exam. After observing the problems of the students Prep4pass provides them with the best Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) Questions so they don't get depressed anymore and pass the Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) exam on the first try. The Pure Certified Portworx Enterprise Professional (PEP) Exam (Portworx-Enterprise-Professional) is designed after consulting with a lot of professionals and getting their reviews.

Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q69-Q74):

NEW QUESTION # 69

A Kubernetes administrator would like to transfer data from an existing Persistent Volume Claim (PVC) from another storage provider to a new Persistent Volume Claim (PVC) being provided by Portworx.

After creating the new PVC on Portworx, what must the administrator do to import the data?

- A. Create a DataExport Cluster Resource that specifies the source and destination PVC.
- **B. Create a busybox pod that connects to both the source and destination PVCs and run a cp command.**
- C. Run the `pxctl import <SOURCE_PVC> <DESTINATION_PVC>` command.

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To migrate data from an existing PVC backed by another storage provider to a new Portworx PVC, the administrator typically creates a temporary pod (often using a lightweight container like busybox) that mounts both the source and destination PVCs. Within this pod, standard Linux file commands such as `cp` or `rsync` are used to transfer data between volumes. This approach leverages Kubernetes volume mounting capabilities and avoids downtime by enabling data migration without removing the source volume immediately. Portworx does not provide a direct `pxctl import` command, nor does it use a DataExport Cluster Resource for PVC data migration. This manual method is widely documented and recommended for stateful data migration tasks involving Kubernetes PVCs across different storage backends **【Pure Storage Portworx Data Migration Guide source】**.

NEW QUESTION # 70

Which command can be used to migrate volumes after cluster pairing is finished?

- A. `kubectl cloudmigrate`
- **B. `pxctl cloudmigrate start`**
- C. `stroktcl cloudmigrate start`

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Once two Portworx clusters are paired, for example in disaster recovery setups, data migration between them can be initiated. The command `pxctl cloudmigrate start` triggers this migration process. It synchronizes volumes, ensuring that data is copied securely and consistently from the source cluster to the destination. This migration is transparent to applications and supports incremental syncs, which helps reduce downtime. The CLI command also provides operational feedback and logs for administrators to monitor progress. Portworx's documentation on disaster recovery workflows emphasizes this command as essential for starting volume migration post-cluster pairing, streamlining data protection and business continuity strategies across multiple sites or cloud regions **【Pure Storage Portworx Disaster Recovery Guide source】**.

NEW QUESTION # 71

What option can a Portworx administrator use to perform snapshots of Repl 2 or 3 volumes when there is limited space on the cluster and no Object Store is configured?

- **A. Skinny Snapshot**
- B. Cloud Snapshot
- C. Local Snapshot

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Skinny Snapshots are a space-efficient snapshot technique used by Portworx for replicated volumes (Repl 2 or 3) when storage capacity is limited and no external Object Store is configured. Unlike full snapshots that duplicate data blocks, skinny snapshots capture only the differences (deltas) since the last snapshot, minimizing space consumption. This method allows administrators to take frequent snapshots without significantly impacting storage availability. Skinny Snapshots are particularly useful for on-premises environments or clusters without access to cloud object storage, balancing snapshot granularity with resource constraints. Official Portworx snapshot documentation explains how skinny snapshots work internally, improving backup and recovery capabilities under tight storage conditions without requiring cloud integration **【Pure Storage Portworx Snapshot Guide source】**.

NEW QUESTION # 72

What are the two components of Stork?

- A. Stork scheduler and an extender
- B. Stork object store and S3 bucket
- C. Stork snapshots and restores

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Stork (Storage Orchestrator for Kubernetes) is a Portworx utility designed to improve Kubernetes storage orchestration. Its two main components are the Stork scheduler and the Stork extender. The scheduler works by placing pods in Kubernetes clusters based on storage constraints, such as volume affinity and anti-affinity, improving application resiliency and data locality. The extender integrates with Kubernetes' default scheduler, influencing pod scheduling decisions to respect storage policies and optimize workload placement. Together, these components enable advanced features such as application-aware migration, snapshot management, and backup coordination. Portworx documentation explains that Stork's design helps maintain stateful application availability during scaling, upgrades, or disaster recovery scenarios by making Kubernetes scheduling storage-aware 【Pure Storage Portworx Stork Guide source】 .

NEW QUESTION # 73

If a Portworx node is down and the Kubernetes cluster is healthy, which command should be used to check Portworx alerts on a healthy node?

- A. `pxctl alerts show`
- B. `kubectl describe node`
- C. `journalctl -lfu portworx*`

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To check Portworx-specific alerts on a healthy node, administrators use the command `pxctl alerts show`. This command displays current alerts raised by Portworx, including warnings and critical notifications about storage, nodes, and cluster health. Even if one node is down, alerts from the healthy nodes can provide insights into cluster-wide issues or the status of the affected node. While `journalctl` displays system and service logs and `kubectl describe node` shows Kubernetes node info, neither provides aggregated Portworx alert data. The Portworx observability documentation recommends using `pxctl alerts show` for focused monitoring and alert management, enabling administrators to respond effectively to operational events within the Portworx cluster 【Pure Storage Portworx Monitoring Guide source】 .
