We will always provide Deep-Security-Professional latest practice exam online the first time for your free downloading within one year.

## Trend Micro Certified Professional for Deep Security Sample Questions (Q70-Q75):

### NEW QUESTION # 70

The Intrusion Prevention Protection Module is enabled, its Behavior is set to Prevent and rules are assigned. When viewing the events, you notice that one of Intrusion Prevention rules is being triggered and an event is being logged but the traffic is not being blocked. What is a possible reason for this?

- A. The Deep Security Agent is experiencing a system problem and is not processing packets since the "Network Engine System Failure" mode is set to "Fail Open".

- B. The default Prevention Behavior in this particular rule may be set to Detect. This logs the triggering of the rule, but does not actually enforce the block.
- C. The Intrusion Prevention rule is being triggered as a result of the packet sanity check failing and the packet is being allowed to pass.
- D. The network engine is running in Inline mode. In Inline mode, Deep Security provides no protection beyond a record of events.

**Answer: B**

#### NEW QUESTION # 71

New servers are added to the Computers list in Deep Security Manager Web config by running a Discover operation. What behavior can you expect for newly discovered computers?

- A. Any servers within the IP address range that are hosting Deep Security Agents will be added to the Computers list and will be automatically activated.
- B. Any servers within the IP address range will be added to the Computers list, regardless of whether they are hosting a Deep Security Agent or not.
- C. Any servers discovered in the selected Active Directory branch hosting a Deep Security Agent will be added to the Computers list.
- D. Any servers within the IP address range hosting a Deep Security Agent will be added to the Computers list.

**Answer: D**

Explanation:

When running a Discovery operation with Automatically Resolve IPs to hostnames enabled, it is possible that the discovery operation will find hostnames where Deep Security Manager can not.

Discovery is able to fall back to using a WINS query or NetBIOS broadcast to resolve the hostname in addition to DNS. Deep Security Manager only supports hostname lookup via DNS.

\* Computers identified with this method can be automatically assigned a group, but not a policy.

\* Agent software found on those computers will NOT be automatically activated.

\* If a computer is listed through other detection methods, it will NOT be listed in the results of this search.

Study Guide - pages (345, 80)

#### NEW QUESTION # 72

How is caching used by the Web Reputation Protection Module?

- A. Caching is used by the Web Reputation Protection Module to keep track of Allowed and Blocked Web sites. Any sites that are Allowed or Blocked do not require the retrieval of a credibility score from the Trend Micro Web Reputation Service.
- B. Caching is used by the Web Reputation Protection Module to temporarily store the credibility score for a Web site. The retrieved credibility score is cached in case the score for the Web site is required again for the life of the cache.
- C. Caching is used by the Web Reputation Protection Module to temporarily store the pages that make up the Web site. The Web site is cached in case the site is visited again for the life of the cache.
- D. Caching is used by the Web Reputation Protection Module to keep track of Web sites that are added to the Allowed list. Any sites added to the Allowed list will be accessible by protected servers regardless of their credibility score.

**Answer: B**

#### NEW QUESTION # 73

The Overrides settings for a computer are displayed in the exhibit. Which of the following statements is true regarding the displayed configuration?

- A. The Protection Modules identified as Inherited in the exhibit have not yet been enabled. Only the Web Reputation and Application Control Protection Modules have been enabled at this point.
- B. The Web Reputation and Application Control Protection Modules have been assigned a different policy than the other Protection Modules and as a result, are displayed with overrides.
- C. The configuration for the Protection Modules is inherited from the policy assigned to this computer, except for the configuration of the Web Reputation and Application Control Protection Modules which have been set at the computer level.

- D. The Protection Modules identified as Inherited in the exhibit have not yet been configured. Only the Web Reputation and Application Control Protection Modules have been configured.

**Answer: C**

Explanation:

When an override is present, settings for those modules (here, Web Reputation and Application Control) have been customized at the computer level and no longer inherit from the assigned policy. The others remain inherited, using policy-level settings.

#### NEW QUESTION # 74

The Firewall Protection Module is enabled on a server through the computer details. What is default behavior of the Firewall if no rules are yet applied?

- A. All traffic is blocked by the firewall until an Allow rule is assigned.
- B. A collection of default rules will automatically be assigned when the Firewall Protection Module is enabled.
- C. All traffic is passed through the Firewall using a Bypass rule
- **D. All traffic is permitted through the firewall until either a Deny or Allow rule is assigned.**

**Answer: D**

Explanation:

When you enable the Firewall Protection Module in Trend Micro Deep Security and no firewall rules are assigned, the default behavior is to permit all network traffic. This default-allow approach ensures that enabling the firewall module does not unintentionally block legitimate traffic and cause disruptions.

According to the official administration guide:

"When you enable the Firewall module but do not assign any rules, all network traffic is permitted by default until you create and assign firewall rules to allow or deny specific traffic." (Source: Trend Micro Deep Security Administrator's Guide, Firewall Protection Module section) Option B is incorrect because Deep Security does not automatically assign a collection of default rules; you must explicitly assign or create them. Option C is incorrect because there is no default-deny stance when rules are absent. Option D does not accurately reflect the module's default operation.
