### 問題 #33

Which statement is TRUE about restoring a volume from a block volume backup in the Oracle Cloud Infrastructure (OCI) Block Volume service?

- A. You can only restore a volume to the same availability domain in which the original block volume resides.
- B. You can restore only one volume from a manual block volume backup.
- **C. You can restore a block volume backup to a larger volume size.**
- D. You can restore a volume from any full volume backup but not from an incremental backup.

答案： C

#### 解題說明:

Restoring a block volume from a backup in OCI provides flexibility and options for scaling and recovery:

Restoring to a Larger Volume Size: When restoring a block volume from a backup, you have the option to restore it to a volume that is larger than the original. This is particularly useful if you anticipate needing more storage capacity after the restore.

Full and Incremental Backups: OCI supports both full and incremental backups. You can restore from any backup type, which makes it possible to restore data efficiently depending on the backup strategy used.

Multiple Restores: Multiple volumes can be restored from a single backup, providing flexibility in disaster recovery scenarios.

Availability Domain: The restored volume can be created in any availability domain within the same region, not necessarily the same one where the original volume was located.

### 問題 #34

Which OCI service would you use to apply kernel security updates to all instances?

- A. Artifact Registry
- B. Data Safe
- **C. OS Management Service**
- D. Container Registry

答案： C

#### 解題說明:

The OS Management Service in Oracle Cloud Infrastructure (OCI) is designed to manage and maintain the operating systems of your compute instances. This service allows you to apply kernel security updates, manage package installations, and monitor the status of updates across all instances in your environment.

Kernel Security Updates: With OS Management Service, you can automate and schedule kernel updates, ensuring that all instances are up-to-date with the latest security patches. This helps maintain the security and integrity of your infrastructure without needing to manually update each instance.

Other Options:

Container Registry: Used for storing and managing container images, not for applying OS updates.

Data Safe: A service focused on database security, not applicable for OS-level updates.

Artifact Registry: A repository for storing and managing software artifacts, not related to OS management.

Relevant OCI Documentation:

OS Management Service Overview

This documentation provides details on how to use OS Management Service to handle kernel security updates and other OS-level management tasks.

### 問題 #35

Which statement is NOT correct regarding the Oracle Cloud Infrastructure (OCI) File System snapshots?

- A. Even if nothing has changed within the file system since the last snapshot was taken, a new snapshot consumes more storage.
- B. Snapshots are a consistent, point-in-time view of your file systems.
- C. Snapshots are accessible under the root directory of the file system at `.snapshot/name`.
- D. Before you can clone a file system, at least one snapshot must exist for the file system.

答案： A

解題說明：

In OCI File Storage, snapshots are point-in-time, read-only copies of a file system that do not immediately consume additional storage beyond the space needed to track changes.

Incorrect Statement: The statement that a new snapshot consumes more storage even if nothing has changed is incorrect. Snapshots are space-efficient; they only consume additional storage as changes are made to the file system after the snapshot is taken. If no changes are made between snapshots, the storage consumption remains minimal.

Correct Statements:

B . Before cloning a file system, at least one snapshot must exist, as the clone operation relies on this snapshot to create a copy.

C . Snapshots are accessible under the `.snapshot` directory, allowing users to view and restore files from specific snapshots.

D . Snapshots provide a consistent, point-in-time view of the file system, ensuring data integrity.

### 問題 #36

Which Traffic Management Steering Policy facilitates the distribution of DNS traffic based on the geographical location of end users?

- A. Proximity Steering
- B. IP Prefix Steering
- C. ASN Steering
- D. Geolocation Steering

答案： D

解題說明：

Geolocation Steering in OCI's Traffic Management Steering Policy allows you to distribute DNS traffic based on the geographical location of the end users. This method helps direct users to the nearest regional endpoint, optimizing latency and improving user experience.

Use Cases: Geolocation Steering is commonly used to deliver region-specific content, comply with data residency laws, or optimize service performance by directing traffic to the closest available servers.

### 問題 #37

You enabled Cross Region Replication for the volume and selected US West (San Jose) as the destination region. What should you do to create a new volume from the volume replica?

- A. Trigger the replica.
- B. Activate the replica.
- C. Initiate the replica.
- D. No action required. By default, the replica is available as a block volume.

答案： D

解題說明：

When Cross-Region Replication is enabled for a block volume in Oracle Cloud Infrastructure (OCI), the replication process automatically creates and maintains a synchronized copy of the block volume in the selected destination region (in this case, US West (San Jose)).

Replica Availability: The replicated volume is immediately available as a block volume in the destination region. You do not need to

take any additional action to activate or trigger the replica.

Creating New Volumes: Since the replica is automatically available as a block volume, you can directly use it to create a new volume in the destination region without any manual intervention.

Relevant OCI Documentation:

Cross-Region Block Volume Replication

This documentation outlines how cross-region replication works and confirms that no additional steps are needed to create a new volume from a replica
