You may urgently need to attend 156-315.81 certificate exam and get the certificate to prove you are qualified for the job in some area. But why 156-315.81 certificate is valuable and useful and can help you a lot? Because passing the test certification can help you prove that you are competent in some area and if you buy our 156-315.81 Study Materials you will pass the test almost without any problems. We are professional in these career for more than ten years and can give you promised success.

CheckPoint Check Point Certified Security Expert R81 Sample Questions (Q300-Q305):

NEW QUESTION # 300

Which one of the following is true about Capsule Connect?

- A. It is supported only on iOS phones and Windows PCs
- **B. It is a full layer 3 VPN client**
- C. It does not support all VPN authentication methods
- D. It offers full enterprise mobility management

Answer: B

Explanation:

Explanation

Capsule Connect is a full layer 3 VPN client that provides secure and seamless remote access to corporate networks from iOS and Android devices. It supports all VPN authentication methods, such as certificates, passwords, tokens, and challenge-response. It also supports split tunneling and seamless roaming.

NEW QUESTION # 301

What is the most ideal Synchronization Status for Security Management Server High Availability deployment?

- A. Lagging
- **B. Synchronized**
- C. Never been synchronized
- D. Collision

Answer: B

Explanation:

The most ideal Synchronization Status for Security Management Server High Availability deployment is Synchronized. Security Management Server High Availability deployment is a feature that allows two or more Security Management Servers to provide redundancy and load balancing for managing security policies and logs. Synchronization Status is a parameter that indicates how up-to-date the databases of the Security Management Servers are with each other. Synchronization Status can have one of the following values:

Synchronized, Lagging, Never been synchronized, or Collision. Synchronized means that the databases of all Security Management Servers are identical and have no conflicts. This is the most ideal status as it ensures consistency and reliability of security management. Lagging means that one or more Security Management Servers have not received all the updates from other Security Management Servers, and their databases are outdated. Never been synchronized means that one or more Security Management Servers have never synchronized their databases with other Security Management Servers, and their databases are independent. Collision means that one or more Security Management Servers have received conflicting updates from other Security Management Servers, and their databases have discrepancies.

NEW QUESTION # 302

You plan to automate creating new objects using new R81 Management API. You decide to use GAIA CLI for this task. What is the first step to run management API commands on GAIA's shell?

- A. `mgmt_cli login user "admin" password "teabag" > id.txt`
- **B. `mgmt_login`**
- C. `mgmt_admin@teabag > id.txt`
- D. `login user admin password teabag`

Answer: B

Explanation:

Explanation

You plan to automate creating new objects using new R81 Management API. You decide to use GAIA CLI for this task.

The first step to run management API commands on GAIA's shell is `mgmt_login`. This command allows you to login to the management server and obtain a session ID, which is required for running other management API commands. You can also specify the user name and password as parameters, or enter them interactively.

The session ID is stored in the file `$CPDIR/tmp/.api_session` by default, unless you specify a different file name. References: R81 Management API Reference Guide, page 15.

NEW QUESTION # 303

Which command shows the current connections distributed by CoreXL FW instances?

- A. `fw ctl affinity -l`
- B. `fw ctl instances -v`
- **C. `fw ctl multik stat`**
- D. `fw ctl iflist`

Answer: C

Explanation:

CoreXL is a performance-enhancing technology that enables the processing CPU cores to concurrently perform multiple tasks on Security Gateways with multiple CPU cores. CoreXL replicates the Firewall kernel multiple times, creating multiple Firewall instances that run on different CPU cores. These Firewall instances handle traffic concurrently, and each Firewall instance is a complete and independent Firewall inspection kernel. To show the current connections distributed by CoreXL FW instances, you can use the command `fw ctl multik stat` on the Security Gateway. This command will display information such as the number of connections, packets, bytes, drops, and errors handled by each CoreXL FW instance, as well as the CPU utilization and affinity of each instance. The other options are not correct because:

* B. `fw ctl affinity -l`: This command will show the CPU affinity of all processes and IRQs on the Security Gateway. It will not show the current connections distributed by CoreXL FW instances.

* C. `fw ctl instances -v`: This command will show the details of all CoreXL FW instances on the Security Gateway, such as their ID, type, state, priority, and interfaces. It will not show the current connections distributed by CoreXL FW instances.

* D. `fw ctl iflist`: This command will show the list of all interfaces on the Security Gateway, along with their names. References: Part 3 - SecureXL, What is CoreXL & SecureXL, SecureXL Fast Accelerator (`fw fast_accel`) for R80.20 and above

NEW QUESTION # 304

Joey wants to upgrade from R75.40 to R81 version of Security management. He will use Advanced Upgrade with Database Migration method to achieve this.

What is one of the requirements for his success?

- **A. Size of the `/var/log` folder of the target machine must be at least 25% of the size of the `/var/log` directory on the source machine**
- B. Size of the `/var/log` folder of the target machine must be at least 25GB or more
- C. Size of the `$FWDIR/log` folder of the target machine must be at least 30% of the size of the `$FWDIR/log` directory on the source machine
- D. Size of the `/var/log` folder of the source machine must be at least 25% of the size of the `/var/log` directory on the target machine

Answer: A

Explanation:

Explanation

One of the requirements for Joey's success in upgrading from R75.40 to R81 version of Security management using Advanced Upgrade with Database Migration method is that the size of the /var/log folder of the target machine must be at least 25% of the size of the /var/log directory on the source machine. Advanced Upgrade with Database Migration method is a procedure that allows administrators to upgrade their Security Management Server to a newer version by migrating their database from an older version to a new machine with a fresh installation of the newer version. One of the steps in this procedure is to copy the /var/log folder from the source machine to the target machine, which contains important log files and configuration files. To ensure that there is enough disk space on the target machine for this operation, it is required that the size of the /var/log folder on the target machine must be at least 25% of the size of the /var/log folder on the source machine.

NEW QUESTION # 305

.....

Our 156-315.81 exam questions have a 99% pass rate. What does this mean? As long as you purchase our 156-315.81 exam simulating and you are able to persist in your studies, you can basically pass the exam. This passing rate is not what we say out of thin air. This is the value we obtained from analyzing all the users' exam results. It can be said that choosing 156-315.81 study engine is your first step to pass the exam. Don't hesitate, just buy our 156-315.81 practice engine and you will succeed easily!
