dumps

If you want to achieve that you must boost an authorized and extremely useful certificate to prove that you boost good abilities and plenty of knowledge in some area. Passing the test 156-836 certification can help you realize your goal and if you buy our 156-836 latest torrent you will pass the exam successfully. Our product boosts many merits and high passing rate. Our products have 3 versions and we provide free update of the 156-836 Exam Torrent to you. If you are the old client you can enjoy the discounts.

CheckPoint Check Point Certified Maestro Expert - R81 (CCME) Sample Questions (Q84-Q89):

NEW QUESTION # 84

Possibilities for a failure in a single SGM of a Security Group include.

- A. SecureXL is not enabled on the SGM.
- B. A change was made with clish instead of gClish, causing the SGM to handle traffic differently than the other SGMs.
- **C. An administrator imported a hotfix into the CPUSE repository of a single SGM.**
- D. There are too many active SGMs in the SG.

Answer: C

Explanation:

Explanation

One of the possible causes of a failure in a single SGM of a Security Group is that an administrator imported a hotfix into the CPUSE repository of a single SGM, instead of using the orchestrator to distribute the hotfix to all the SGMs in the Security Group. This can create a mismatch in the software versions and configurations of the SGMs, and lead to unexpected behavior and errors.

NEW QUESTION # 85

What can be learned from the output of `sx_api_ports_dump.py` command?

- A. Orchestrator port status
- **B. Information about backplane bonds**
- C. Information about downlink ports only
- D. Information about Security Groups

Answer: B

Explanation:

NEW QUESTION # 86

What type of cluster can a Security Group be compared to?

- A. VSLS
- B. Active / Backup
- **C. Load Sharing Active / Active**
- D. Active / Standby

Answer: C

Explanation:

A Security Group (SG) in Check Point Maestro is comparable to a Load Sharing Active/Active cluster. This is because a Security Group consists of multiple Security Group Members (SGMs) that actively share the traffic load, provide high availability, and ensure scalability. Each SGM processes traffic according to the Security Group policy and synchronizes its state with other members, similar to how a Load Sharing Active/Active cluster distributes traffic across multiple nodes.

Exact Extract:

"A Security Group can be compared to a Load Sharing Active/Active cluster because it consists of multiple Security Group Members that share the traffic load and provide high availability and scalability. Each Security Group Member is an active firewall that processes traffic according to the Security Group policy and synchronizes its state with other members. The Maestro Orchestrator acts as a load balancer that distributes the traffic among the Security Group Members based on their capacity and availability."

-Check Point Certified Maestro Expert (CCME) R81.X Courseware, Module 2: Maestro Security Groups, Lesson 2.1:

Introduction to Security Groups, page 2-4

-Check Point R81 Maestro Administration Guide, Chapter 2: Maestro Security Groups, Section: Security Group Overview, page 2-3 Explanation of Options:

* A. Load Sharing Active / Active: Correct, as the Security Group operates like a Load Sharing Active

/Active cluster, with all SGMs actively processing traffic and sharing the load, as described in the documentation.

* B. VSL: Incorrect, as Virtual System Load Sharing (VSL) is a specific Check Point clustering mode for Virtual Systems, not directly comparable to a Security Group's architecture.

* C. Active / Backup: Incorrect, as this implies only one node is active while others are passive, which does not align with the active load-sharing nature of Security Groups.

* D. Active / Standby: Incorrect, as this also implies a single active node with standby nodes, whereas all SGMs in a Security Group are active.

NEW QUESTION # 87

What is the maximum number of Appliances within the same Security Group?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

The maximum number of appliances within the same security group is 31. This is because a security group can have up to 31 Security Group Modules (SGMs) of the same or different models, and each SGM is an appliance that runs the Check Point software. A security group can span across multiple chassis, and each chassis can have up to 16 SGMs. However, the total number of SGMs in a security group cannot exceed 31.

NEW QUESTION # 88

When working with Maestro, what is the difference between using Clish and gClish?

- A. Clish commands apply to all UP SG members, by default. gClish commands apply to all SG members, by default.
- B. Clish commands apply only to a specific SG member. gClish commands apply to all UP SG members, by default.
- C. Clish commands are for testing purposes only and cannot be saved, gClish commands apply to all SG members, by default.
- **D. Clish commands are run on the SG members. gClish commands are run on the MHO and applied to all connected SG members in a specified group.**

Answer: D

NEW QUESTION # 89
