- A. The cost of the replica matches the cost of the source volume; for example, the replica of a high-performance volume will be billed at the high-performance rate.
- B. Replication is synchronous, so it may slightly degrade block volume performance.
- C. The replica cannot be directly mounted on a compute instance. Instead, it must be activated, creating a clone that will be available for mounting.
- D. Replication replaces the need for block volume backups.

**Answer: C**

#### NEW QUESTION # 65

You have a Terraform configuration that includes a VCN and three compute instances in the VCN. The configuration also includes a cloud-init script for each compute instance. You upload the configuration to OCI Resource Manager and run an apply job. Which option correctly describes the order of execution, assuming the configuration does not model explicit dependencies?

- A. Resource Manager provisions the VCN, then the compute instances one at a time. Terraform does not wait for the cloud-init script of each instance to complete before proceeding to the next instance.
- B. Resource Manager provisions the resources from top to bottom in the configuration file.
- C. Resource Manager provisions the VCN, then all compute instances in parallel.
- D. Resource Manager provisions the VCN, then the compute instances one at a time. Terraform waits for the cloud-init script of each instance to complete before proceeding to the next instance.
