Our company pays high attentions to the innovation of our AWS-Solutions-Architect-Associate study dump. We constantly increase the investment on the innovation and build an incentive system for the members of the research expert team. Our experts group specializes in the research and innovation of our AWS-Solutions-Architect-Associate exam practice guide and supplements the latest innovation and research results into the AWS-Solutions-Architect-Associate Quiz prep timely. Our experts group collects the latest academic and scientific research results and traces the newest industry progress in the update of the AWS-Solutions-Architect-Associate study materials.

In order to cater to different kinds of needs of customers, three versions for AWS-Solutions-Architect-Associate learning materials are available. You can choose one you prefer according to your own needs. AWS-Solutions-Architect-Associate PDF version is printable and you can study anywhere and anyplace. AWS-Solutions-Architect-Associate Soft test engine supports MS operating system and have two modes for practice. In addition, AWS-Solutions-Architect-Associate Soft test engine can simulate the real exam environment, and your confidence for the exam can be strengthened through this version. AWS-Solutions-Architect-Associate Online test engine is convenient and easy to study, it supports all web browsers, and it has testing history and performance review, so that you can have a general review before next training.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q365-Q370):

NEW QUESTION # 365

A solutions architect is creating a data processing job that runs once daily and can take up to 2 hours to complete. If the job is interrupted, it has to restart from the beginning. How should the solutions architect address this issue in the MOST cost-effective manner?

- A. Create a script that runs locally on an Amazon EC2 Reserved Instance that is triggered by a cron job.

- B. Create an AWS Lambda function triggered by an Amazon EventBridge (Amazon CloudWatch Events) scheduled event
- C. Use an Amazon Elastic Container Service (Amazon ECS) task running on Amazon EC2 triggered by an Amazon EventBridge (Amazon CloudWatch Events) scheduled event.
- **D. Use an Amazon Elastic Container Service (Amazon ECS) Fargate task triggered by an Amazon EventBridge (Amazon CloudWatch Events) scheduled event.**

Answer: D

NEW QUESTION # 366

A company hosts its order processing system on AWS. The architecture consists of a frontend and a backend.

The frontend includes an Application Load Balancer (ALB) and Amazon EC2 instances in an Auto-Scaling group. The backend includes an EC2 instance and an Amazon RDS MySQL database.

To prevent incomplete or lost orders, the company wants to ensure that order states are always preserved. The company wants to ensure that every order will eventually be processed, even after an outage or pause. Every order must be processed exactly once.

- A. Create an AWS Lambda function to replace the backend EC2 instance. Subscribe the function to an Amazon Simple Notification Service (Amazon SNS) topic. Configure the frontend to send orders to the SNS topic.
- **B. Create an Auto Scaling group for the backend. Configure the backend EC2 instances to consume messages from an Amazon Simple Queue Service (Amazon SQS) FIFO queue. Configure a dead-letter queue (DLQ) for the SQS queue.**
- C. Create an Auto Scaling group and an ALB for the backend. Create a read replica for the RDS database in a second Availability Zone. Update the backend RDS endpoint.
- D. Create an Auto Scaling group and an ALB for the backend. Create an Amazon RDS proxy in front of the RDS database. Update the backend EC2 instance to use the Amazon RDS proxy endpoint.

Answer: B

Explanation:

Use SQS FIFO to durably persist orders, guarantee order processing semantics, and decouple producers

/consumers. FIFO queues provide "exactly-once processing" with message deduplication and "preserve message order." Visibility timeouts and retries ensure messages are "processed eventually" without being lost; failed messages go to a DLQ for later reprocessing. This pattern aligns with Well-Architected reliability guidance to "queue work to protect against overload and failures" and to ensure "durable, idempotent processing" with retry and backoff. ALB/RDS Proxy/read replicas (A, B) improve availability/connection management but do not guarantee durable handoff or exactly-once processing. SNS (D) is pub/sub and does not provide FIFO semantics in this option, nor a DLQ per subscription for exactly-once. Therefore, frontends write orders to an SQS FIFO queue; backend workers in an Auto Scaling group consume, process idempotently, and use a DLQ for poison messages to meet "no lost orders," "eventual processing," and "exactly-once" requirements.

NEW QUESTION # 367

A company plans to use an Amazon S3 bucket to archive backup data. Regulations require the company to retain the backup data for 7 years.

During the retention period, the company must prevent users, including administrators, from deleting the data.

The company can delete the data after 7 years.

Which solution will meet these requirements?

- A. Create an S3 Object Lock default retention policy that retains data for 7 years in governance mode. Create an S3 Lifecycle policy to delete the data after 7 years.
- **B. Create an S3 Object Lock default retention policy that retains data for 7 years in compliance mode. Create an S3 Lifecycle policy to delete the data after 7 years.**
- C. Create an S3 Batch Operations job to set a legal hold on each object for 7 years. Create an S3 Lifecycle policy to delete the data after 7 years.
- D. Create an S3 bucket policy that denies delete operations for 7 years. Create an S3 Lifecycle policy to delete the data after 7 years.

Answer: B

Explanation:

Comprehensive and Detailed Step-by-Step Explanation:

The requirement is to prevent data deletion by any user, including administrators, for 7 years while allowing automatic deletion afterward.

S3 Object Lock in Compliance Mode (Correct Choice - C)

Compliance mode ensures that even the root user cannot delete or modify the objects during the retention period.

After 7 years, the S3 Lifecycle policy automatically deletes the objects.

This meets both immutability and automatic deletion requirements.

Governance Mode (Option B - Incorrect)

Governance mode prevents deletion, but administrators can override it.

The requirement explicitly states that even administrators must not be able to delete the data.

S3 Bucket Policy (Option A - Incorrect)

An S3 bucket policy can deny deletes, but policies can be modified at any time by administrators.

It does not enforce strict retention like Object Lock.

S3 Batch Operations Job (Option D - Incorrect)

A legal hold does not have an automatic expiration.

Legal holds must be manually removed, which is not efficient.

Why Option C is Correct:

S3 Object Lock in Compliance Mode prevents deletion by all users, including administrators.

The S3 Lifecycle policy deletes the data automatically after 7 years, reducing operational overhead.

NEW QUESTION # 368

A company uses Amazon Redshift for its data warehouse. The company wants to ensure high durability for its data in case of any component failure. What should a solutions architect recommend?

- A. Increase the data retention period.
- B. Deploy Amazon Redshift in Multi-AZ.
- C. Enable cross-Region snapshots.
- **D. Enable concurrency seating.**

Answer: D

NEW QUESTION # 369

A solutions architect is designing the cloud architecture for a new application being deployed on AWS. The process should run in parallel while adding and removing application nodes as needed based on the number of jobs to be processed. The processor application is stateless. The solutions architect must ensure that the application is loosely coupled and the job items are durably stored. Which design should the solutions architect use?

- A. Create an Amazon SQS queue to hold the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch configuration that uses the AMI. Create an Auto Scaling group using the launch configuration. Set the scaling policy for the Auto Scaling group to add and remove nodes based on network usage.
- **B. Create an Amazon SQS queue to hold the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch template that uses the AMI. Create an Auto Scaling group using the launch template. Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of items in the SQS queue.**
- C. Create an Amazon SNS topic to send the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch configuration that uses the AMI. Create an Auto Scaling group using the launch configuration. Set the scaling policy for the Auto Scaling group to add and remove nodes based on CPU usage.
- D. Create an Amazon SNS topic to send the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch template that uses the AMI. Create an Auto Scaling group using the launch template. Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of messages published to the SNS topic.

Answer: B
