dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q309-Q314):

NEW QUESTION # 309
Which two are true for a dbt clone command?
Choose 2 options.

- A. It requires the reference to a manifest from a previous dbt invocation.
- B. It allows testing your code changes on downstream dependencies outside of dbt (such as a BI tool).
- C. It allows comparison between manifests of source and target dbt runs, but does not create any objects itself.
- D. It can be used to replicate data across different data warehouses.
- E. It creates new versions of your dbt models suffixed with _v#.

Answer: A,B

Explanation:
The correct answers are A and C.
dbt clone is a command introduced to efficiently replicate existing relations (tables/views) from one schema /environment to another within the same warehouse without fully rebuilding them. It typically leverages warehouse-level "clone" functionality (e.g., Snowflake zero-copy clone). To know what to clone, dbt needs information about previously built models; this is stored in artifacts like manifest.json. Therefore, A is correct:

it requires a reference to a previous manifest/state to know which models and locations to operate on.

C is also correct because cloning a production schema into a development schema enables you to test code changes while pointing downstream tools (like BI dashboards) at the cloned data. That way, BI or ML systems can exercise new dbt logic without impacting real production objects.

Option B describes state:modified / state comparison behavior, but dbt clone does create (or clone) objects, so B is false.

Option D is incorrect because clone works within a warehouse, not across different warehouses.

Option E is wrong: _v# suffixing is for model versioning, not cloning.

Thus, A and C correctly describe the behavior and purpose of dbt clone.

NEW QUESTION # 310

"Isn't debugging harder with many smaller models in a DAG?" How would you address this concern expressed by a colleague?

- A. "Our DAG will be simple, so debugging model dependencies won't be a concern."
- B. "Smaller models are easier to test individually, leading to faster issue identification."
- C. "We'll rely extensively on snapshots to trace errors back to their origin."
- D. "Debugging is slightly harder, but the benefits outweigh the added effort."

Answer: B

Explanation:
Emphasize how modularity isolates problems and enables targeted testing. While the other options have some truth, option B presents the most convincing argument.

NEW QUESTION # 311

You want to compare the current version of a file in your working directory to the most recently committed version. Which Git command would be most helpful?

- A. git status
- B. git log
- C. git show
- D. git diff

Answer: D

Explanation:
git diff shows line-by-line differences between versions, letting you compare your working version to the committed one (HEAD).

NEW QUESTION # 312

You receive a compilation error stating:Model depends on a node named 'ref data' which was not found

- A. Examine the SQL within the model where the error occurs for typos or incorrect ref() usage.
- B. Review downstream models that might be referencing ref_data incorrectly.
- C. Search for a model named ref_data within your project or any included packages.
- D. Check the configuration of the ref_data data source.

Answer: C

Explanation:
Compilation errors often mean missing dependencies. Start by ensuring ref_data actually exists as a model.

NEW QUESTION # 313

You have a dbt model that performs complex aggregations. During development, you notice some models take excessively long to run, but they ultimately complete without errors. Which of the following might be true?

- A. The models are at risk of failing if the source data grows substantially.
- B. Downstream models will inherit the performance issues.

- C. This behavior automatically triggers an optimization feature within dbt.
- D. These models likely have issues with joins or CTE structure impacting performance.

Answer: A,D

Explanation:
A and B are likely true. Models without errors can still signify potential scaling issues and inefficient logic. C is not necessarily true. Downstream models won't inherit performance issues unless they directly rely on the output of these slow models. D is false. dbt has optimization features, but they often require manual configuration, not automatic triggering.

NEW QUESTION # 314
